Re: May 2015 Water Quality Sampling, and
Analysis of Trends and Standards Exceedances
NEWSVT Landfills
Coventry, Vermont

Dear Joe:

Enclosed please find the results of the May 2015 water quality sampling round conducted at the NEWSVT Landfills in Coventry, Vermont in accordance with Conditions 46, 47 and 48 of the issued *Solid Waste Disposal Facility Certification* ("Solid Waste Cert.", effective October 18, 2010). Sampling was conducted on 5/4/15 through 5/6/15, by Wendy Krembs; Waite-Heindel Environmental Management (WHEM) Project Scientist, Christopher Page; WHEM Staff Scientist, and Miles Waite; WHEM Senior Hydrogeologist.

Refer to the map of water quality sampling locations on page 1 of Appendix 1.

Solid waste was being placed in Phase IV during the sampling round in May 2015.

Method(s) of Reporting Trends in Water Quality Data: This report describes recent trends in the water quality results. Those reported trends are stated for the two broad categories of inorganic and organic parameters. In each category, the trends are estimated by visually comparing the values for this current round of sampling to the previous round of sampling. Solid Waste Program's (SWP) comment letter on the Fall 2014 Semi-Annual WQ Monitoring Report agreed with this approach (K. Kathan, 3/03/2015).

This March 2015 comment letter from SWP also requests to receive the full-period trend analysis of three parameters that routinely exceed their primary Groundwater Enforcement Standards (GES; Dissolved Arsenic, Iron and Manganese), as was indicated in our Fall 2014 WQ Monitoring Report. We are still in the process of gathering and graphing all of those data from the earliest times of record for all monitoring locations throughout the site. We anticipate completing this more detailed analysis of trends for these three parameters by the end of summer 2015. See Recommendation #5 at the end of this report.

DEC Comment Letters on Two Previous Sampling Rounds:

1. Comment Letter dated 10/24/2014: A comment letter was received from the VT ANR DEC Solid Waste Program (Kasey Kathan) dated Oct. 24, 2014 regarding the report on the May 2014 semi-annual sampling event, and also on the report titled *Groundwater Quality at Down-Gradient Property Boundaries* dated 9/19/2014 (WHEM) (see Appendix 1, p. 15). Kasey's comments on two overall topics are briefly paraphrased below, *with our responses beneath each item in italics*:

- Semi-Annual Monitoring Report for May 2014 (dated 7/15/2014):
  - GES exceedances not related to Unlined Landfills [Item C]: Discuss this more thoroughly (e.g., MW-E1, recent primary GES exceedances for As, Cd, Mn, Pb.).
    The wells that are clearly down-gradient from Unlined Areas A & B are discussed in a separate section of this report (Section I.C.1) beginning on page 8. All other compliance monitoring wells are presumed to not be affected by Unlined Areas A & B.
  - Surface Water Standards Exceedances [Item D]: Discuss this more thoroughly.
    Exceedances of Surface Water Standards are discussed in Section II of this report, beginning on page 13.
  - Replacement Well between Lined Landfill Phases I & II, and Unlined Landfills [Item "General Comments #1"]: Address this replacement well.
    This replacement well (MW-F1) is described in Section I.B of this report (p. 7). It was installed in April 2015, and was sampled for the first time in May 2015.
  - Clarify how "trends" are reported [Item "General Comments #2"].
    This clarification was provided in the Fall 2014 WQ Report ("Reported trends are visual comparisons to previous sampling round"), and continues with this report.
  - Include Stabilized Turbidity values [Item "General Comments #3"].
    This request was addressed in the Fall 2014 WQ Report ("Stabilized turbidity results from low-flow well sampling procedures are now reported with Indicator Parameters, as wells as D.O. and ORP"), and continues with this report. See tables in Appendix 1.

- Groundwater Quality at Down-Gradient Property Boundaries Report (dated 9/19/2014):
  - Three contaminants of primary concern at this site are As, Fe, Mn (Discussion Item C):
    Duly noted. We refer to these inorganics as parameters rather than contaminants, since there are natural sources for these parameters, as well as

both direct and indirect anthropogenic sources, that appear to be involved at this site.

- Field parameters reported [Comment Item #1]: Please include field parameters in future reports.
  Field parameters are included with this report, in the tables in Appendix 1.
- Elevated Arsenic in MW-BRW-9S [Comment Item #3]: Please address this unusual occurrence, including possible anthropogenic sources such as gravel excavation or automotive disposal; and potential installation and sampling of additional monitoring wells to better determine the extent of this elevated arsenic area.
  This topic is addressed in a separate report that will be sent under separate cover. See Recommendation #6, at the end of this Report.
- Compliance with Groundwater Protection Rule and Strategy [Comment Item #4]: An attempt to resolve the issue of defining background groundwater concentrations for As, Fe and Mn must be made.
  This topic continues to be evaluated by WHEM, including evaluation of these three parameters since the beginning of monitoring at this site, in relation to their upgradient/downgradient positions at various times. As indicated in Recommendation #5 at the end of this Report, we anticipate submitting this additional information by the end of Summer 2015.

2. Comment letter dated March 3, 2015: A comment letter was received from VT ANR DEC Solid Waste Program (Kasey Kathan) dated March 3, 2015 regarding the report on the October 2014 semi-annual sampling event (see Appendix 1, p. 19). Kasey commented on two topics with followup requests. These are briefly paraphrased below, *with our responses beneath each item in italics*:

- Longer term trend analysis of primary parameters of concern [Para. 3]: This will be useful "in determining what appropriate background concentrations may be for this site".
  This is addressed above, in response to the 10/24/2014 comment letter. This topic continues to be evaluated by WHEM, including evaluation of these three parameters [Arsenic, Iron and Manganese] since the beginning of monitoring at this site, in relation to their upgradient/downgradient positions at various times. We anticipate submitting this additional information by the end of Summer 2015 (Rec. # 5).

- Elevated temperatures in Phase III Underdrain UD-3 [Paras. 5 to end]: This situation and elevated arsenic concentrations bear further consideration moving forward.
  Brian Beaudoin, Project Engineer (Sanborn, Head & Associates) has reviewed these data and the engineering literature on elevated temperatures in landfills. He indicates that the most likely reason for the elevated temperatures in the Phase III underdrain

discharge is the heat of decomposition, as solid waste decomposes in Phase III. This indication is supported by the equally rising leachate temperatures that WHEM staff have recorded in semi-annual samples of Primary Leachates from Phase III Cells 1 and 2 – see table and graph on pp. 203 - 204 of Appendix 1. Elevated Arsenic concentrations in MW-BRW-9S do not appear to be related to UD-3, as indicated in the report on this topic that will be sent under separate cover. This situation merits continued attention in the future – see Recommendation #7 at the end of this Report.

I. GROUNDWATER

WHEM conducted low-flow sampling on all monitoring wells with sufficient water following WHEM's low-flow sampling SOP. Wells with insufficient water for low-flow sampling methodology were purged and sampled using dedicated hand bailers. As per the SOP, wells were field-measured for depth to water, and temperature, specific conductivity, dissolved oxygen, pH, oxidation reduction potential and turbidity readings were obtained until readings stabilized (or after one half hour of data collection; whichever comes first), and samples collected. Groundwater samples were analyzed by Endyne, Inc., of Williston, Vermont for landfill indicator parameters, inorganic compounds, and volatile organic compounds (VOCs) by EPA Method 8260C.

See summary tables and individual lab reports in Appendices 1 and 2. For a summary of recent trends, see Appendix 1, page 3; for a table showing standards exceedances in the May 2015 sampling round, see Appendix 1 pages 6-8. Unusual groundwater results are summarized in the Summary Section (VIII), Item #12.

A. Up-gradient or Cross-Gradient of Lined and Unlined Landfills

Based on groundwater elevations and the map of groundwater flow directions in May 2015 (see this report's section VII on p. 28, and the map on p. 2 of Appendix 1), there are ten wells that provide information on the up-gradient and cross-gradient groundwater at this site: **MW-409, MW-705, MW-706, MW-801D-R, MW-801BR-R, MW-804-S-R, DW-#21 (office), DW-#36516 (St. Onge 2005 drilled well), BRW-3S, and BRW-3D**. In May 2015 we sampled all ten of these up-gradient wells. See Appendix 1, page 1 for the locations of these wells. See summary tables in Appendix 1 and individual lab reports in Appendix 2. For a summary of recent trends, see Appendix 1, page 3; for tables showing standards exceedances in the May 2015 sampling round, see Appendix 1, pages 6-8. Unusual groundwater results from this sampling round are summarized in the Summary section (

INORGANICS, Up-Gradient: In the May 2015 sampling round, inorganic compounds showed upward trends in **DW-21 (Office)**, **MW-801D-R**, the **St. Onge** well, **BRW-3S, and BRW-3D**, while downward trends were noted in **MW-409, MW-705**, **MW-706, 801BR-R** and **MW-804SR.**

These May 2015 trends were visually estimated in comparison to the previous sampling event in October 2014.

DW-21 (Office; bedrock non-potable water supply well): No primary or secondary Vermont Groundwater Enforcement Standards (GESs) were exceeded, as is typical. Total sodium decreased to within its normal range, after it was detected at its highest concentration to date in October 2014 (although it did not exceed its GES then). All inorganic and indicator compound concentrations remain within the normal ranges of historic values for this well.

MW-409: Total iron and total manganese each continues to exceed the secondary GES, as is typical of this well. Total chloride was detected at its highest concentration to date (19 mg/L), which is well below the secondary GES of 250 mg/L. Specific conductance exceeds the VT Maximum Acceptable Change (MAC) of +100 us/cm, as it has sporadically in the past. All other inorganic and indicator compound concentrations remain within the normal ranges of historic values for this well.

MW-705: Total iron exceeds the secondary GES, as is generally typical. Total and dissolved manganese exceeds the secondary GES, as is typical. Total chloride continues on an increasing trend, and was detected at its highest concentration to date (100 mg/L), which is well below the secondary GES of 250 mg/L. Specific conductance exceeds the MAC, as it has periodically in the past. Total sodium was detected at its second highest concentration (7.3 mg/L) since May 2011, but continues to be well below the secondary GES of 250 mg/L. All other inorganic and indicator compound concentrations remain within the normal ranges of historic values for this well.

MW-706: Total manganese exceeds the primary and secondary GES, as is typical, and is back within its historic range after a recent increasing trend. Dissolved manganese continues to exceed the secondary GES, as it has since May 2013. All other inorganic and indicator compound concentrations remain within the normal ranges of historic values for this well.

MW-801BR-R (bedrock monitoring well): Total arsenic was non-detected for the first time since May 2013. Total iron continues to exceed the secondary GES, as is typical, and is returning to its historic range after being detected at its lowest concentration in October 2014. Total and dissolved manganese were non-detected for the first time since May 2013. pH exceeds the Health Advisory (HA) and MAC, as it has periodically in the past. Total sodium was detected at its lowest concentration to date, far below the GES. With the exception of dissolved iron which exceeds the secondary PAL, all inorganic and indicator compound concentrations appear to be back within the normal ranges of historic values for this well, after a spike in concentrations in October 2013.

MW-801D-R: Total iron exceeds the secondary GES, as is typical. Total manganese exceeds the secondary GES at its second highest concentration since May 2008 after being non-detected

through May 2014. This exceedance is not unexpected given the historic trends in this well. Dissolved manganese was detected at its highest concentration to date (0.140 mg/L), which exceeds the secondary GES, as it has in the past. Upon inquiry to the laboratory regarding these high concentrations, the lab verified these results. Specific conductance exceeds the MAC for the first time. All other inorganic and indicator compound concentrations remain within the normal ranges of historic values for this well.

MW-804S-R: No primary or secondary GESs were exceeded, as has been typical of this well since May 2013, with the exception of October 2014 when total iron and total manganese exceeded the secondary GES. All inorganic and indicator compound concentrations appear to be back within the normal ranges of historic values for this well, after a spike in concentrations occurred in October 2014.

St. Onge 2005 Well (#36516; bedrock water supply well serving the farm and farmhouse on the east side of Airport Road): Total arsenic exceeds the primary GES, as periodically occurs. Total iron was detected at its highest concentration since May 2009, and exceeded the secondary GES, as periodically occurs. Total and dissolved manganese exceeded the secondary GES, as periodically occurs. Dissolved iron was detected at its second highest concentration since October 2010, but did not exceed the secondary GES, although it did exceed the PAL. Total chloride remains within normal historic ranges, and exceeds the secondary PAL, as is typical. Specific conductance exceeds the MAC, as it has in the past. All inorganic and indicator compound concentrations remain within the normal ranges of historic values for this well.

BRW-3S and BRW-3D were installed in May 2013 and September 2013, respectively, as part of the evaluation of groundwater quality at down-gradient property boundaries. At that time, SWP personnel requested that these two wells be added to the semi-annual sampling rounds and report.

Detailed groundwater elevation data, followed by our evaluation of groundwater flow directions in September 2014 report titled Groundwater Quality at Down-Gradient Property Boundaries indicate that MW-BRW-3S and 3D are not down-gradient of the lined or unlined landfill facilities at NEWSVT. Therefore, we recommend that these two wells be deleted from the semi-annual monitoring network and report beginning with the October 2015 sampling round. See Recommendation #4 at the end of this Report.

BRW-3S: Total and dissolved manganese exceed the secondary GES, as is typical. Total and dissolved iron continue to be detected, and are below the secondary GES, as is typical. Total Sodium was detected at its lowest concentration to date, and remains below the primary GES. No other inorganic compounds were detected, and all other indicator compounds remain within normal ranges of historic values for this well.

BRW-3D: Total arsenic exceeds the primary GES for the fourth time since sampling of this well began in September 2013, at its highest concentration to date (27 ug/L). Total iron exceeds the secondary GES, as has been typical on all but one sampling event. Dissolved iron decreased to below the secondary PAL, after it was detected at its highest concentration to date in October 2014, when it did not exceed the secondary GES, but did exceed the secondary PAL. Total manganese increased and exceeds the secondary PAL, which is not unusual. Dissolved manganese was non-detected for the first time. Total Sodium was detected at its lowest concentration to date, well below the primary GES. All other inorganic and indicator compound concentrations remain within normal ranges of historic values for this well.

VOLATILE ORGANIC COMPOUNDS (VOCS), Up-gradient: In May 2015, there were no VOCs detected in the up-gradient wells **(DW-21 (Office)**, **St. Onge well, MW-409, MW-705**, **MW-706, MW-801D-R, 801BR-R**, **MW-804SR, MW-BRW-3S, and MW-BRW-3D)**. This has been the case for many years, except in May 2013, when two VOCs were detected for the first time in DW-36516, the St. Onge farm well. The well was re-sampled in August 2013 and all VOC results were non-detected, and were also non-detected in the October 2013 sample. Therefore, it appears that the one-time detections of two VOCs in May 2013 in the St. Onge farm well were anomalous.

I. B. Between Lined and Unlined Landfills

There is now one compliance monitoring well (**MW-F1**) between the lined and unlined landfills. Two previous surficial aquifer monitoring wells were located in this zone: MW-2R and MW-410R. During the fall of 2013, NEWSVT excavated solid waste and soils between the unlined landfills (Areas A & B) and Phases I and II lined landfills, including at the location of these two wells. These wells were found to be constructed in or through solid waste, so they were decommissioned. Therefore, these wells were not present during the May or October 2014 semi-annual groundwater sampling events. A proposed location for one replacement well (MW-F1) was approved by the SWP in a letter dated December 11, 2014 (included in Appendix 1, page 21) and the well MW-F1 was installed in April 2015. During this May 2015 sampling event, MW-F1 was developed by purging sand and silt from the well bottom, prior to sampling it for the first time.

MW-F1, Groundwater Elevation and Flow Direction: The water level in MW-F1 on May 5, 2015 was 24.5 ft. BGS, at elevation 703.1 ft. This water table elevation was very similar to the previous water table elevations in nearby form MW-2R, and a little deeper than in former MW-410R. As indicated in WHEM's July 2013 Report titled *Summary of Hydrogeologic Characterizations*, groundwater within unlined Areas A & B is well up into the trash, up to elevations 730 ft. and higher, and is therefore chemically impacted by the trash in unlined Areas A & B. This impacted groundwater flows outward radially in all directions from Areas A & B, including southward toward lined Phases I and II, and therefore toward new MW-F1.

INORGANICS in MW-F1: Total and dissolved manganese exceeded the primary and secondary GESs. Total and dissolved iron both exceeded the secondary GES. Total arsenic and total lead exceed the primary PALs. The metals concentrations in these first-round results from MW-F1 are generally between the concentrations in the two former wells between the lined and unlined landfills. See the summary table of lab results on page 43 of Appendix 1.

VOCs in MW-F1: Benzene was detected above the GES. Four other VOCs were detected (chlorobenzene; 8.0 ug/L, 1,4-dichlorobenzene; 2.0 ug/L, cis-1,2-dichloroehene; 2.1 ug/L, diethylether; 1.0 ug/L, and ethylbenzene; 1.0 ug/L). All concentrations were either well below their GESs, or they have no GES. There was no clear pattern of comparison to the VOCs in the two former wells between the lined and unlined landfills (see summary table, p. 43, Appendix 1).

MW-F1 Summary: The groundwater elevation in new MW-F1, compared to the previously measured higher groundwater elevations within Unlined Areas A & B indicates that MW-F1 is in the flowpath lf leachate impacts from these unlined landfills. This is corroborated by the elevated concentrations of metals, and the detections of VOCs in this first round of sampling at MW-F1. As would be expected, despite the removal of the former solid-waste-impacted soils from a substantial portion of the zone between Unlined Areas A & B and Lined Phases I and II, and despite the replacement of those impacted soils with clean fill, leachate from Unlined Areas A & B continues to impact this zone.

I. C. Down-gradient of Lined and Unlined Landfills

Fifteen compliance monitoring wells provide information in the zones down-gradient of the lined and unlined landfills at NEWSVT. Based on the groundwater elevations and estimated groundwater flow paths from May 2015 data, and based on the September 2014 evaluation of groundwater flow directions beneath and within Unlined Areas A & B, these down-gradient monitoring wells can be divided into the two groups listed below. Water quality results from the May 2015 sampling round are discussed separately for each group beginning below.

I.C.1. Down-gradient from Unlined Areas A & B (10 wells): MW-A-1, MW-B-1, MW-D-1R, MW-D-2, MW-P-2R, MW-P-5, MW-P8, MW-BRW-1, MW-BRW-2R, and probably **MW-412-R**.

I.C.2. Down-gradient of lined Phases I-IV and not impacted by Unlined Areas A & B (5 wells): MW-E1, MW-P6, MW-103, MW-703, and MW-805S.

I.C.1. INORGANICS, Down-gradient from Unlined Areas A & B:
MW-A-1, MW-B-1, MW-D-1R, MW-D-2, MW-P-2R, MW-P-5, MW-P8, MW-BRW-1, MW-BRW-2R, and probably **MW-412-R**:

In the May 2015 sampling round, inorganic compounds showed upward trends in **MW-A1, MW-B1, MW-P2R,** and **MW-P8.** Downward trends were noted in **MW-D1R, MW-D2**, **MW-P5** and **MW-412R**. In February 2015, a downward trend was noted in **BRW-1** and **BRW-2R**. These trends were visually estimated in comparison to the previous sampling event at these wells.

MW-A1: Total arsenic exceeds the primary GES, as is typical. Total and dissolved manganese exceed the primary and secondary GES, as is typical. Total and Dissolved iron exceed the secondary GES as is typical. Total chloride was detected at its second highest concentration since May 2014, but is well below the secondary GES. All other inorganic and indicator compound concentrations remain within the normal ranges of historic values for this well.

MW-B1: Total arsenic exceeds the primary GES, as is typical. Total manganese exceeds the secondary GES, as it does periodically. There are no other GES exceedances in this well. All other inorganic and indicators compound concentrations remain within the normal ranges of historic values for this well.

MW-D1R: Total arsenic exceeds the primary GES, as is typical. There are no other GES exceedances in this well, and several other parameters were very low. Total manganese was low (below the primary and secondary GES, although it typically exceeds the secondary GES). Total iron typically exceeds the secondary GES, and was detected below it for only the third time. Dissolved manganese sporadically exceeds the secondary GES, and was non-detected for only the second time. All other inorganic and indicator compound concentrations remain within the normal ranges of historic values for this well.

MW-D2: This well has shown generally upward trends in the concentrations of several metals since approximately 2000-2014 (As, Mn, Fe), as well as for several indicator parameters (COD, Na, Cl, Spec. Cond.). During this round, it appears this upward trend has continued from October 2014, after generally decreasing during the May 2014 sampling event. Total arsenic exceeds the primary GES, as is typical, and was at its highest concentration to date (1,300 ug/L). Total nickel exceeds the primary GES, as is typical. Total chloride exceeds the secondary GES, as is typical, and was detected at its highest concentration to date (1,700 mg/L). Total and dissolved manganese exceed the primary and secondary GES as is typical. Total and dissolved iron exceeds their secondary GESs, as is typical. Total sodium decreased to within its normal range after its highest concentration in October 2014; it continues to exceed the GES, as it typical. COD and specific conductance exceed the MAC this round, as often occurs. All other inorganic and indicator compound concentrations remain within the normal ranges of historic values for this well.

MW-P2R: Total arsenic exceeds the primary GES, as is typical. Total chromium increased to its highest concentration to date (140 mg/L) and exceeds the primary GES for only the second time

since May 2006. Total lead increased and exceeds the primary GES at its highest concentration since May 2008, although it has sporadically exceeded the GES in the past. Total nickel was detected at its highest concentration to date, and exceeds the primary GES, as is typical. Total and dissolved manganese exceed the primary and secondary GES, as is typical, with total manganese increasing significantly since the previous sampling event in October 2014. Total chloride continues to exceed the secondary GES, as is typical. Total iron was detected at its highest concentration to date (120 mg/L), and exceeds the secondary GESs, as is typical. Dissolved iron continues to exceed the secondary GES, as is typical. Total sodium exceeds the MAC as is typical, and is back within historic ranges after being detected at its highest concentration in October 2014. Upon inquiry to the laboratory regarding these high concentrations, the lab verified these results. All other inorganic and indicator compound concentrations remain within the normal ranges of historic values for this well.

MW-P5: Total and dissolved manganese exceed the secondary GES, as is typical. Total iron was detected below the secondary GES, and appears to be returning back within normal ranges after its unusual non-detection during the May 2014 sampling event, although it typically exceeds the secondary GES. All other inorganic and indicator compound concentrations remain within the normal ranges of historic values for this well.

MW-P8: Total arsenic declined to below the primary GES for the second time since May 2005, although it continues to exceed the PAL. Total and dissolved manganese exceed the primary and secondary GES, as is typical. Total manganese was back up within its normal range after being detected at its lowest concentration in October 2014; it continues to be well above the primary and secondary GESs. Total and dissolved iron exceeds the secondary GES, as is typical. Total nickel was non-detected for the first time since October 2001. Specific conductance exceeds the MAC, as it does periodically. All other inorganic and indicator compound concentrations remain within the normal ranges of historic values for this well.

MW-412R: Total and dissolved iron both exceed their secondary GESs, as is typical. Most other IOCs were significantly lower than usual. Total manganese declined to below the primary GES for only the second time since sampling began; the first time occurred in May 2014. It is also below the secondary GES for the first time. Dissolved manganese was non-detected for the first time. Both typically exceed the primary and secondary GESs. Total chloride was detected at its lowest concentration to date, after being detected at its highest concentration in October 2014 but always well below the secondary GES. Total sodium was detected at its lowest concentration to date, and remains well below the GES. All other inorganic and indicator compound concentrations remain within the normal ranges of historic values for this well.

Black River Wetland Wells (BRW-1, BWR-2R):
These wells are located in the Black River wetland north of the unlined landfill Areas A and B, and are not sampled in May or October in order to minimize the physical impact on the wetland

during sampling access. They are sampled once a year in February (last sampled for permit compliance on February 10, 2015). BRW-1 and 2R were also sampled twice in March 2014 as part of WHEM's evaluation of groundwater quality at the northern and western property boundaries (results were reported in a separate document, titled NEWSVT Landfills BRW-1 and BRW-2R Monitoring in Black River Wetland, dated April 1, 2014).

BRW-1: Total and dissolved manganese were detected at their lowest concentrations to date, but continue to exceed the primary and secondary GES, as is typical. Total iron was detected at its lowest concentration to date, but continues to exceed the secondary GES as is typical. Dissolved iron continues to exceed the secondary GES, as is typical. Total chloride was detected at its highest concentration to date (13 mg/L), but continues to be well below the secondary GES. Total sodium was detected at its second highest concentration (10 mg/L) since March 2006, and remains well below the GES. All other inorganic and indicator compound concentrations remain within the normal ranges of historic values for this well.

BRW-2R: Total iron decreased but continues to exceed the secondary GES, as is typical. Dissolved iron increased to its highest concentration to date (1.6 mg/L), and exceeds the secondary GES, as is typical. Dissolved iron continues its increasing trend, which began in 2012. Total and dissolved manganese exceed the secondary GES, as is typical.

VOCs, Down-gradient from Unlined Areas A & B:

Groundwater samples are analyzed for VOCs by EPA Method 8260C. Seven of the ten wells located down-gradient from the Unlined Areas A & B showed no detectable VOCs in May 2015 (**MW-B1, MW-D1R, MW-P5, MW-P8** and **MW-412R**). **BRW-1 and BRW-2** were both non-detected for VOCs (and SVOCs) in February 2015.

In the May 2015 sampling round, organic compounds showed upward trends in **MW-D2**, and downward trends were noted in **MW-A1** and **MW-P2R.**

In **MW-A1:** Benzene (6.9 ug/L) and vinyl chloride (6.4 ug/L) each remain within historic ranges and exceed the GESs, as is typical. Chloroethane (15.8 ug/L) has routinely been detected since May 2005, and decreased since the previous sampling event in October 2014; there is no GES for this compound. Diethyl Ether (126 ug/L) has routinely been detected since May 2008, and increased since the previous sampling event in October 2014; there is no GES for this compound. MTBE (3.2 ug/L) remains stable since the previous sampling event in October 2014, and is well below the GES of 40 ug/L. Tetrahydrofuran (71.4 ug/L) increased since the previous sampling event in October 2014; there is no GES for this compound. Toluene (1.9 ug/L) continues to be routinely detected well below its GES. No new VOCs were detected in MW-A1. All other organic compound concentrations remain within the normal ranges of historic values for this well.

MW-D2: Acetone (21,200 ug/L) exceeds the GES as is typical, and is within the higher end of its historic range. 2-Butanone (46,800 ug/L) exceeds the GES as is typical, and is within the higher end of its historic range. 2-methyl-2-pentanone (MIBK) was detected at its highest concentration to date (1,410 ug/L), although it has only been detected sporadically in this well since October 2007, and hasn't been detected since October 2012; there is no GES for this compound. No new VOCs were detected in MW-D2. All other organic compound concentrations remain within the normal ranges of historic values for this well.

MW-P2R: Benzene (5.8 ug/L) exceeds the GES, as it has since October 2013. Other VOCs declined in concentrations. Chloroethane was non-detected, which is unusual. It has been detected in this well on all sampling events since October 2004 with the exception of October 2008 when it was non-detected for the first time. T-butanol was also non-detected this round, which is unusual, as it has been detected in this well on all sampling events since May 2009. Isopropylbenzene was non-detected, which is unusual, as it has been detected in this well on all sampling events since October 2004. No new VOCs were detected in MW-P2R. All other detected VOCs remain within normal ranges

I.C.2. <u>INORGANICS, Down-gradient of lined Phases I-IV, and Not Impacted by Unlined Areas A & B:</u>
MW-E1, MW-P6, MW-103, MW-703, and MW-805S:

In the May 2015 sampling round, inorganic compounds showed upward trends in **MW-P6** and **MW-805S.** Downward trends were noted in **MW-E1, MW-103** and **MW-703.** These trends were visually estimated in comparison to the previous sampling event at these wells.

MW-E1: Total arsenic decreased to its lowest concentration, and below the primary GES for the third time since sampling began in 2005, but continues to exceed the PAL. Total iron was detected at its lowest concentration to date, but continues to exceed the secondary GES, as is typical. Total and dissolved manganese exceed the secondary GES, as is typical. Total sodium was detected at its lowest concentration to date, and continues to be well below the primary GES. All other inorganic and indicator compound concentrations remain within the normal ranges of historic values for this well.

MW-P6: Total and dissolved iron and manganese exceed the secondary GESs, as is typical. Total manganese also exceeds the primary GES, as periodically occurs. Total chromium had been non-detected since May 2012, but was detected at a low concentration (5.3 ug/L) this round, at well below the GES. All other inorganic compound and indicator concentrations remain within the normal ranges of historic values for this well.

MW-103: Total manganese exceeds the secondary GESs, as is typical. All other inorganic and indicator compound concentrations remain within the normal ranges of historic values for this well.

MW-703: Total manganese exceeds the primary and secondary GES, as is typical. Dissolved manganese exceeds the secondary GES, as is typical. Total iron was detected at a concentration below the GES for the first time since October 2007. All inorganic and indicator compound concentrations remain within the normal ranges of historic values for this well.

MW-805S: Since October 2013, many inorganics concentrations in this well declined to within historic ranges, after high detections in May 2013. This is likely due to a revised sampling procedure implemented by WHEM in October 2013 that reduced the siltiness of the sample, by bailing the well on our first field day, then allowing the well to recharge overnight before sampling. We will follow this procedure in future sampling events, as this well has insufficient water to sample using low flow methodology.

Total arsenic exceeds the primary GES, as it periodically does. Total lead, total nickel and total manganese exceed the primary GESs, as they do periodically. Total iron and manganese exceed the secondary GESs, as is typical. All other inorganic and indicator compound concentrations remain within the normal ranges of historic values for this well.

VOCs, Down-gradient of lined Phases I-IV, and Not Impacted by Unlined Areas A & B:
Groundwater samples are analyzed for VOCs by EPA Method 8260C. **BRW-3S, BRW-3D, MW-E1, MW-P6, MW-103, MW-703 and MW-805S** were all non-detected for VOCs. This is often the case, with the exception of sporadic low-level detections in some wells.

II. SURFACE WATER, INCLUDING UNDERDRAIN OUTLETS

A. Upstream Surface Water

There are two upstream surface water sampling points at NEWSVT: **SW-1 Black River Upstream** and **SW-5 St. Onge Stream**. Both of these locations could be sampled in May 2015. SW-1 and SW-5 showed increasing trends in May 2015 (as visually estimated, in comparison to results from the previous sampling event). Surface water quality results are compared to the new Vermont Water Quality Standards (VWQS) for Protection of Human Health (Consumption of Organisms only), and Protection of Aquatic Biota (chronic criteria), effective October 30, 2014. Many of the possible standards exceedances that we mention in this report have not been seen in the past when results were compared to the former standards, but the new standards (effective October 30, 2014) have new hardness-dependent formulas for determining some of the metals standards.

Beginning in May 2011, we changed SW-3 (Landfill Brook, formerly called "Upstream") to the "Downstream" category, and we moved its field location approximately 150 feet downstream because it was generally dry at its original location. SW-3 (Landfill Brook Southeast) is now downstream of the maintenance shop (by surface water flow direction), but it is up-gradient (by groundwater flow direction) of the solid waste disposal cells.

See location map, summary tables and individual lab reports in the Appendices. For a summary of recent trends, see Appendix 1, the table on page 4. For a table showing exceedances of surface water quality standards in the May 2015 sampling round, see Appendix 1, page 9.

II.A.1 INORGANICS, Upstream:

(SW-1) Black River: There were no exceedances of the VWQS protection of human health (consumption of organisms only), or protection of aquatic biota (chronic criteria) as has sporadically occurred in the past. Cadmium, Chromium, Copper, Lead, Nickel and Zinc possibly technically exceeded their VWQS standards because the laboratory's practical quantitation limits are higher than this round's hardness-dependent standards for the Protection of Aquatic Biota, Chronic Criteria. All other inorganic compound concentrations remain within the normal ranges of historic values for this location, or were non-detected.

St. Onge Stream (SW-5): There were no exceedances of the VWQS as has sporadically occurred in the past. Cadmium, Chromium, Copper, Lead, Nickel and Zinc possibly technically exceeded their VWQS standards because the laboratory's practical quantitation limits are higher than this round's hardness-dependent standards based on hardness, per above. All inorganic compound concentrations remain within the normal ranges of historic values for this location, or were non-detected.

II.A.2 VOCs, Upstream: No VOCs (EPA Method 8260C) were detected at either of the two upstream surface water sampling locations in May 2015, as has always been the case in the past.

II.A.3 SEMI-VOLATILE ORGANICS (SVOCs): No SVOCs (EPA Method 8270C) were detected at either of the upstream surface water sampling locations in May 2015, as has always been the case in the past.

II.B. Downstream Surface Water

Six downstream surface water sampling locations are part of the Water Quality Monitoring Program at NEWSVT (in addition to the four underdrain outlets, which are discussed in a separate section below): Black River Downstream (SW-2), Landfill Brook Southeast (SW-3), Landfill Brook Downstream (SW-4), Eastern Stream (SW-6), Western Stream (SW-7), and the Wetland Below UD-1, 2 (SW-8). All had sufficient water in May 2015, and were successfully sampled.

In the May 2015 sampling round, inorganic compounds showed upward trends in **SW-2** and **SW-4**, and downward trends in **SW-3, SW-6, SW-7** and **SW-8**. These May 2015 trends were visually estimated from the previous sampling event in October 2014.

See the map for locations, and the summary tables and individual lab reports in the Appendices. For a summary of recent trends, see the table in Appendix 1, page 4; for a table showing standards exceedances in the May 2015 sampling round, see page 9.

II.B.1 INORGANICS, Downstream:

SW-2 (Black River Downstream): There were no exceedances of the VWQS as has sporadically occurred in the past. Cadmium, Chromium, Copper, Lead, Nickel and Zinc possibly technically exceeded their VWQS standards based on hardness, per above. All other inorganic compound concentrations remain within the normal ranges of historic values for this location, or were non-detected.

SW-3 (Landfill Brook Southeast; formerly referred to as "Landfill Brook Upstream"): Total arsenic exceeds the VWQS as it has on all but one occasion in October 2014. COD has returned to its historic range, after its lowest concentration to date in October 2014. Cadmium, Chromium, Copper, Lead and Zinc possibly technically exceeded their VWQS standards based on hardness, per above. All other inorganic compound concentrations remain within the normal ranges of historic values for this location, or were non-detected.

SW-4 (Landfill Brook Downstream): Total iron exceeds the VWQS; its last exceedance occurred in October 2008. Total Sodium was detected at its highest concentration to date; there is no standard. Cadmium, Chromium, Copper, Lead, Nickel and Zinc possibly technically exceeded their VWQS standards based on hardness, per above. All other inorganic compound concentrations remain within the normal ranges of historic values for this location, or were non-detected.

SW-6 (Eastern Stream): Total Arsenic, Total Iron, Total Lead and Total Nickel exceed the VWQSs, as often occurred in the past. Chloride continues an increasing trend (63 mg/L), and was detected at its highest concentration since May 2006. Cadmium, Chromium, Copper and Zinc possibly technically exceeded their VWQS standards based on hardness, per above. All other inorganic compound concentrations remain within the normal ranges of historic values for this location, or were non-detected.

SW-7 (Western Stream): Total Arsenic (7 ppb) exceeds the VWQS (1.5 ppb), as is typical. Cadmium, Chromium, Copper, Lead, Nickel and Zinc possibly technically exceeded their VWQS standards based on hardness, per above. Underdrain 3 (the outlet for Phase III's

underdrain) is located approximately 500 feet upstream of SW-7, and it also generally has elevated arsenic concentrations above the VWQS (3 ppb in May 2015), so this Arsenic concentration at SW-7 presumably reflects the groundwater intercepted by Underdrain 3. The temperature in SW-7 was near the upper end of its typical range this round (12.4 deg. C). It is typically higher than the other surface water locations, which also presumably reflects the groundwater intercepted by Underdrain 3 (20.4 deg. C), whose temperature has been quite warm since about 2006, and continues to increase to date. As indicated on page 3 of this report, Brian Beaudoin, Project Engineer (Sanborn, Head & Associates) has reviewed these data and the engineering literature on elevated temperatures in landfills. He indicates that the most likely reason for the elevated temperatures in the Phase III underdrain discharge is the heat of decomposition, as solid waste decomposes in Phase III. This indication is supported by the equally rising leachate temperatures that WHEM staff have recorded in semi-annual samples of Primary Leachates from Phase III Cells 1 and 2 – see table and graph on pp. 203 - 204 of Appendix 1. All other inorganic compound concentrations remain within their historic ranges for this location, or were non-detected.

SW-8 (Wetland Below UD-1, 2): Total lead exceeds the VWQS, as periodically occurs. Cadmium, Chromium, Copper, Nickel and Zinc possibly technically exceeded their VWQS standards based on hardness, per above. All other inorganic compound concentrations remain within the normal ranges of historic values for this location, or were non-detected.

II.B.2 VOCs, Downstream:

Volatile Organic Compounds (VOCs by Method 8260C) continued to be non-detected in May 2015 at all sampled downstream surface water sampling locations, as has always been the case in the past.

II.B.3 SVOCs, Downstream:

Semi-VOCs (by EPA Method 8270C) continued to be non-detected in May 2015 at all sampled downstream surface water sampling locations, as has always been the case in the past.

II.C. Underdrains

Each of the lined landfill phases (Phases 1, 2, 3, and 4) has an independent underdrain system of perforated pipes bedded in high-permeability drainage sand and stone located either in trenches or a continuous blanket beneath or within the engineered soil drainage system. The purpose of the underdrain systems is to isolate the lined landfills from groundwater, and to discharge the intercepted groundwater by gravity flow at separate locations on the lower slopes around the margins of the landfill. The Solid Waste Management Division has determined that the discharges from these underdrains are regulated as surface water. Underdrain water quality is compared to the Vermont Water Quality Standards (VWQS) Protection of Human Health (Consumption of Organisms only), and/or Protection of Aquatic Biota (chronic criteria).

See the map, summary tables and individual lab reports in Appendix 1. For a summary of recent trends, see the table in Appendix 1, page 4; for a table showing standards exceedances in the May 2015 sampling round, see page 9. These May 2015 trends were visually estimated in comparison to the previous sampling event in October 2014.

The underdrain pipes are periodically flushed with high-pressure water. NEWSVT personnel reported that the underdrain pipes were last flushed on September 23, 2014, and are scheduled to be flushed again in July or August 2015.

Solid waste was being placed in Phase IV during the sampling round in May 2015.

II.C.1. Phase 1 Underdrain

The underdrain outlets for Phases 1 and 2 are immediately adjacent to each other, and discharge onto the grassy slope northwest of the lined landfill. In early October 1997, the underdrain outlet system for Phases 1 and 2 was divided; the left underdrain outlet pipe (when viewed facing uphill, with the Black River wetland to your back) is the outlet for the Phase 1 underdrain system.

INORGANICS, Phase 1 Underdrain: In May 2015, inorganics showed increasing trends in the Phase 1 underdrain. Total nickel exceeds the VWQS, which has periodically occurred in the past. COD was detected at its highest concentration to date; there is no standard. Cadmium, Chromium, Copper, Lead, Nickel and Zinc possibly technically exceeded their VWQS standards because the laboratory's practical quantitation limits are higher than this round's hardness-dependent standards for the Protection of Aquatic Biota, Chronic Criteria. All inorganic compound concentrations remain within the normal ranges of historic values for this location, or were non-detected.

VOCs, Phase 1 Underdrain: In May 2015, all VOCs were non-detected, as has occurred since October 2010.

SVOCs, Phase 1 Underdrain: In May 2015, all SVOCs were non-detected as has been the case since before October 2004.

Summary, Phase 1 Underdrain: The overall view of the May 2015 sampling results of the Phase 1 underdrain gives no indication of landfill impacts. VOCs and SVOCs were non-detected, and inorganic concentrations were within historic ranges.

II.C.2. Phase 2 Underdrain

At the adjacent Phase 1 and Phase 2 underdrain outlet locations, the right pipe (when viewed facing uphill) is the outlet for the Phase 2 underdrain system.

INORGANICS, Phase 2 Underdrain: In May 2015, inorganics showed increasing trends in the Phase 2 underdrain. Total Arsenic exceeds the VWQS, as is typical. Total Nickel exceeds the VWQS, which periodically occurs. Cadmium, Chromium, Copper, Lead and Zinc possibly technically exceeded their VWQS standards based on hardness, per above. All other inorganic compound concentrations remain within the normal ranges of historic values for this location, or were non-detected.

VOCs, Phase 2 Underdrain: In May 2015, no VOCs were detected. Diethylether was non-detected, after its first detection since October 2011 during the last sampling event in October 2014. There has been a historic pattern of sporadic, low-level VOC detections in the Phase 2 underdrain's discharge, which is presumed to be due to condensation of landfill gases (because detections of these VOCs disappear after the underdrain pipes are flushed with high-pressure water).

SVOCs, Phase 2 Underdrain: SVOCs were non-detected in May 2015 in the Phase 2 Underdrain, as has been the case since before October 2004.

Summary, Phase 2 Underdrain: The overall view of the May 2015 sampling results of the Phase 2 underdrain gives no indication of landfill impacts. VOCs and SVOCs were non-detected, and inorganic concentrations were within historic ranges.

II.C.3. Phase 3 Underdrain

INORGANICS, Phase 3 Underdrain: In May 2015, inorganics showed increasing trends in the Phase 3 underdrain. Total Arsenic exceeds the VWQS as is typical. Cadmium, Chromium, Copper, Lead, Nickel and Zinc possibly technically exceeded their VWQS standards based on hardness, per above. All other inorganic compound concentrations remain within the normal ranges of historic values for this location, or were non-detected.

- The temperature in UD-3 has been rising since approximately 2006, and was 20.4 deg. C in May 2015. This may be the reason that the temperature in SW-7 (the surface water sampling station located about 500 feet downstream from where the flow from UD-3 enters this small stream) was near the upper end of its typical range in May 2015 (12.4 deg. C). As indicated on page 3 of this report, Brian Beaudoin, Project Engineer (Sanborn, Head & Associates) has reviewed these data and the engineering literature on elevated temperatures in landfills. He indicates that the most likely reason for the elevated temperatures in the Phase III underdrain discharge is the heat of decomposition within the solid waste in Phase III. This indication is supported by the equally rising leachate temperatures that WHEM staff have recorded in semi-annual samples of Primary Leachates from Phase III Cells 1 and 2 – see table and graph on pp. 203 – 204 of Appendix 1. This situation merits continued attention in the future.

VOCs, Phase 3 Underdrain: VOCs in the Phase 3 Underdrain were all non-detected in May 2015, as has been the case since 1999 (with the exception of one-time detections of acetone and MEK in May 2008).

SVOCs, Phase 3 Underdrain: SVOCs were all non-detected in May 2015 in the Phase 3 Underdrain, as has been the case since before October 2004.

Summary, Phase 3 Underdrain: The overall view of the May 2015 sampling results at the Phase 3 Underdrain gives no indication of landfill impacts. VOCs and SVOCs were non-detected. All inorganic concentrations were within historic ranges.

II.C.4. Phase 4 Underdrain

INORGANICS, Phase 4 Underdrain: In May 2015, inorganics showed decreasing trends in the Phase 4 underdrain. Total Arsenic exceeds the VWQS, as is typical. Cadmium, Chromium, Copper, Lead, Nickel and Zinc possibly technically exceeded their VWQS standards based on hardness, per above. All other inorganic compound concentrations remain within the normal ranges of historic values for this location, or were non-detected.

VOCs, Phase 4 Underdrain: VOCs in the Phase 4 Underdrain were all non-detected in May 2015, which has been the case since sampling began in 2006 (except for low-level detections of 2 VOCs in May and June 2011).

SVOCs, Phase 4 Underdrain: SVOCs were all non-detected in May 2015 in the Phase 4 Underdrain, as has been the case since sampling began in October 2006.

Summary, Phase 4 Underdrain: The overall view of the May 2015 sampling results at the Phase 4 Underdrain gives no indication of landfill impacts. VOCs and SVOCs were non-detected, and inorganic concentrations were within historic ranges.

III. DRINKING WATER

Beginning with the October 1994 sampling round, drinking-water wells are considered by the Solid Waste Management Program as groundwater monitoring wells, so dissolved metals are analyzed in each well sample. Results for these wells have been incorporated into the groundwater section, reported above.

IV. LEACHATE

Eight leachate samples were collected on May 8, 2015 (see Field Sampling Summary Sheets on pages 133 - 134 of Appendix 1); seven from the primary leachate collection systems of individual phases of the lined landfill, plus one sample from the combined-leachate above-ground storage tank (AST). No samples needed to be collected from the secondary leak-detection

systems of individual phases of the lined landfill, per instructions from NEWSVT personnel. Leachate quality is compared to the Vermont Hazardous Waste Management Regulations Toxicity Characteristic; Chapter 2, Table 1: Maximum Concentration of Contaminants for the Characteristic of Toxicity (March 2013).

The samples were analyzed for total metals and other inorganics, volatile organics (by EPA Method 8260C), and semi-volatile organics (by EPA 8270C). See the leachate quality summary tables in Appendix 1, and individual lab reports in Appendix 2. For a summary of recent leachate trends, see the table on page 5 of Appendix 1. These May 2015 trends were visually estimated in comparison to the previous sampling event in October 2014.

Each of the seven individual solid-waste disposal phases or cells was sampled using the primary leachate pump in its corresponding pump house, with the assistance of NEWSVT staff. Also, a "combined leachate" sample was collected from the piping of the large above-ground combined leachate holding tank (AST) used to fill the trucks. The liquid in this AST is a combination of Primary leachate and Secondary detection-system liquids from all of the phases and cells of the lined landfill.

Solid waste was being placed in Phase IV during the sampling round in May 2015.

Comparison to Vermont Toxicity Characteristics: None of the lab results for the May 2015 leachate samples exceeded the Vermont Toxicity Characteristic concentrations (VT Hazardous Waste Management Regulations, March 2013).

IV.A. Phase I Leachate: Primary

A sample of the primary Phase I leachate was obtained by pumping at the primary leachate sampling port located inside the Phase I leachate house. Summary tables of results are in Appendix 1. None of the lab results for the May 2015 Phase I primary leachate samples exceeded the Vermont Toxicity Characteristic concentrations (VT Hazardous Waste Management Regulations, March 2013).

INORGANICS, Phase 1 Primary Leachate: Metals and other inorganics in the Phase I primary leachate showed decreasing trends in May 2015. Total antimony declined to within its historic range, after it was detected at its highest concentration (although a low value) in October 2014; there is no Toxicity Characteristic. All other detected inorganics were generally within historical ranges, and all were below Toxicity Characteristics.

VOCs, Phase 1 Primary Leachate: VOCs showed a generally decreasing trend in May 2015. Acetone, 2-butanone and diethyl-ether were at their lowest concentrations since August 2002. Chlorobenzene (5.3 ug/L) continues to be detected at a low concentration for the third time (the first detection occurred in October 2013); however, this is well below the Toxicity

Characteristic. T-butanol increased to within its historic range, after it was detected at its lowest concentration in October 2014. It has been routinely detected since October 2007; there is no Toxicity Characteristic. 4-Methyl-2pentanone was non-detected after its lowest concentration in October 2014, although it has routinely been detected since October 1992; there is no Toxicity Characteristic. Tetrahydrofuran and toluene were at their lowest concentrations since November 2006; there are no Toxicity Characteristics for these compounds. All other VOCs were generally within the lower end of their historical ranges, and all were below Toxicity Characteristics.

SVOCs, Phase 1 Primary Leachate: SVOCs showed decreasing trends in May 2015. All SVOCs are within historic ranges and below Toxicity Characteristics.

IV.B. Phase II Leachate: Primary

A sample of the primary Phase II leachate was obtained by pumping at the primary leachate sampling port located inside the Phase II leachate house. Summary tables of results are in Appendix 1. None of the lab results for the May 2015 Phase II primary leachate sample exceeded the VT Toxicity Characteristic concentrations.

INORGANICS, Phase II Primary Leachate: Metals in the Phase II primary leachate showed generally mixed trends, while other inorganics showed decreasing trends in May 2015. All metals and other inorganics were within historic ranges and below Toxicity Characteristics.

VOCs, Phase II Primary Leachate: VOCs showed generally decreasing trends in May 2015. Tetrahydrofuran was detected at its lowest concentration since November 2006; there is no Toxicity Characteristic. All other VOC concentrations were within historic ranges and below Toxicity Characteristics.

SVOCs, Phase II Primary Leachate: SVOCs showed generally decreasing trends in May 2015. Phenol decreased to its lowest concentration since May 2008. It has been routinely detected May 1997; there is no Toxicity Characteristic. 3&4-Methylphenol decreased to its lowest concentration since the start of sampling in May 1996. It has been routinely detected since then; there is no Toxicity Characteristic. Total cresol decreased to its lowest concentration to date. It has had routine detections since October 2007; and is well below the Toxicity Characteristic. All other SVOC concentrations were within their historic ranges, and all were below Toxicity Characteristics.

IV.C. Phase III Cell 1 Leachate: Primary

A sample of the primary Phase III Cell 1 leachate was obtained at the primary leachate sampling port located in the Phase III Cell 1 leachate house. Summary tables of results are found in Appendix 1. None of the lab results for the May 2015 Phase III Cell 1 primary leachate sample exceeded the VT Toxicity Characteristic concentrations.

INORGANICS, Phase III Cell 1 Primary Leachate: Metals and other inorganics in the Phase III Cell 1 primary leachate showed increasing trends in May 2015. Total arsenic (2.8 mg/L), increased to its highest concentration to date, but it still well below its Toxicity Characteristic of 5.0 mg/L. Total cobalt was detected a low concentration; it has been non-detected since May 2012; there is no Toxicity Characteristic. Total Molybdenum was detected for only the second time (the first occurred in October 2009); there is no Toxicity Characteristic. Total Kjeldahl Nitrogen (TKN) decreased to within its historic range, after it was detected at its highest concentration in October 2014; there is no Toxicity Characteristic. pH (8.67 s.u.) was measured at its highest value this round. All other metals and other inorganic compounds were within their historic ranges, and all were below Toxicity Characteristics.

VOCs, Phase III Cell 1 Primary Leachate: VOCs showed decreasing trends in May 2015. Tetrahydrofuran was detected at its lowest concentration to date; it is routinely detected, and there is no Toxicity Characteristic. Toluene was detected at its lowest concentration since October 2003. It has routinely been detected since sampling began in February 1999; there is no Toxicity Characteristic. All other VOCs were within their historic ranges, and all were below Toxicity Characteristics.

SVOCs, Phase III Cell 1 Primary Leachate: SVOCs were non-detected this round, after three low-level detections in October 2014. Prior to this, SVOCs had been non-detected since October 2010.

IV.D. Phase III Cell 2 Leachate: Primary

A sample of the primary Phase III Cell 2 leachate was obtained at the primary leachate sampling port located in the Phase III Cell 2 leachate house. Summary tables of results are in Appendix 1. None of the lab results for the May 2015 Phase III Cell 2 primary leachate sample exceeded the VT Toxicity Characteristic concentrations.

INORGANICS, Phase III Cell 2 Primary Leachate: Metals and other inorganics in the Phase III Cell 2 primary leachate showed increasing trends in May 2015. Total arsenic (1.3 mg/L) was at its highest concentration to date, but is still well below its Toxicity Characteristic of 5.0 mg/L. Total arsenic concentrations appear to be on an increasing trend since October 2012. Total chromium (0.33 mg/L) was detected at its highest concentration to date, but is still well below its Toxicity Characteristic of 5.0 mg/L. Total cobalt was detected at a low concentration for the first time since May 2012; there is no Toxicity Characteristic. Total Vanadium (0.082 mg/L) was detected at its highest concentration to date. It has been detected intermittently since April 2007; there is no Toxicity Characteristic. TKN decreased to within its historic range, after its highest concentration in October 2014; there is no Toxicity Characteristic. All other metals and other inorganic compounds were within their historic ranges, and all were below Toxicity Characteristics.

VOCs, Phase III Cell 2 Primary Leachate: VOCs showed decreasing trends in May 2015. 1,4-Dichlorobenzene and styrene both decreased to within their historic ranges after being detected at their highest concentrations in October 2014; there are no Toxicity Characteristics for these compounds, and they are routinely detected in this leachate. Diethylether was detected at its lowest concentration since sampling began in February 2002; there is no Toxicity Characteristic for this compound, and it is routinely detected in this leachate. Ethylbenzene was detected at its lowest concentration since August 2005, after its highest concentration in October 2014; there is no Toxicity Characteristics for this compound, and it is routinely detected in this leachate. All other VOCs were within their historic ranges, and all were below Toxicity Characteristics.

SVOCs, Phase III Cell 2 Primary Leachate: SVOCs were non-detected this round, as has been the case since October 2010.

IV.E. Phase IV Cell 1 Leachate: Primary

Solid waste was being placed in Phase IV during the May 2015 sampling round. A sample of the primary Phase IV Cell 1 leachate was obtained at the primary leachate sampling port located in the Phase IV Cell 1 leachate house. Summary tables of results are in Appendix 1. None of the lab results for the May 2015 Phase IV Cell 1 primary leachate sample exceeded the VT Toxicity Characteristic concentrations.

INORGANICS, Phase IV Cell 1 Primary Leachate: Metals in the Phase IV Cell 1 primary leachate showed increasing trends, while other inorganics showed decreasing trends in May 2015. Total antimony decreased to within its historic range, after it was detected at its highest concentration in October 2014; there is no Toxicity Characteristic and it is routinely detected. Total arsenic (0.56 mg/L) and total chromium (0.40 mg/L) were detected at their highest concentrations to date, but well below their respective Toxicity Characteristics of 5.0 mg/L, and both are routinely detected. It appears that total arsenic has been on an increasing trend since May 2012 in this leachate. Total cobalt (0.034 mg/L) was detected for only the second time (the first occurred in May 2012); there is no Toxicity Characteristic. Total vanadium (0.054 mg/L) was detected for the first time since May 2012; there is no Toxicity Characteristic. TKN, total sodium, and specific conductivity all decreased to within their historic ranges after being detected at their highest concentrations in October 2014. There are no Toxicity Characteristics, and they are all routinely detected. All other metals and other inorganic compounds were within their historic ranges, and all were below Toxicity Characteristics.

VOCs, Phase IV Cell 1 Primary Leachate: VOC concentrations generally showed increasing trends in May 2015. On the other hand, Acetone and 2-butanone were detected at their lowest concentrations since sampling began in November 2006, although they are both routinely detected. Naphthalene was detected at its highest concentration to date, although it has only been detected in this leachate since May 2012; there is no Toxicity Characteristic. All other

detected VOCs were within historic ranges and below Toxicity Characteristics.

SVOCs, Phase IV Cell 1 Primary Leachate: SVOC concentrations showed decreasing trends in May 2015. Naphthalene continued to decrease after its first detection in October 2013; there is no Toxicity Characteristic. Phenol was non-detected for the first time since sampling began in April 2007; there is no Toxicity Characteristic, and it is routinely detected. 3&4-Methylphenol was detected at its lowest concentration to date; there is no Toxicity Characteristic and it is routinely detected. Total cresol was detected at its lowest concentration to date, and continues to be well below its Toxicity Characteristic. Bis (2-ethylhexyl) phthalate was non-detected this round after its second detection in October 2014. All other SVOCs were within their historic ranges, and all were below Toxicity Characteristics.

IV.F. Phase IV Cell 2 Leachate: Primary

Solid waste was being placed in Phase IV during the May 2015 sampling round. A sample of the primary Phase IV Cell 2 leachate was obtained at the primary leachate sampling port located in the Phase IV Cell 2 leachate house. Summary tables of results are found in Appendix 1. None of the lab results for the May 2015 Phase IV Cell 2 primary leachate sample exceeded the VT Toxicity Characteristic concentrations.

INORGANICS, Phase IV Cell 2 Primary Leachate: Metals in the Phase IV Cell 2 primary leachate showed increasing trends, while other inorganics showed decreasing trends in May 2015. Total arsenic (0.41 mg/L) and total chromium (0.33 mg/L) were detected at their highest concentrations to date, but well below their Toxicity Characteristics of 5.0 mg/L. Total cobalt (0.039 mg/L) and total vanadium (0.069 mg/L) were detected for the first time since May 2012; these compounds do not have Toxicity Characteristics. Total iron and total manganese rose to within their historic ranges, after being detected at their lowest concentrations in October 2014. BOD (330 mg/L) was reported as abnormally low this round, but the laboratory results include a qualifier indicating an Oxygen depletion of < 2.0 mg/L, so the reported value has a higher degree of uncertainty. TKN, total sodium and specific conductance declined to within their historic ranges, after being detected at their highest concentrations in October 2014. pH (7.65 s.u.) was measured at its highest value this round. All other metals and inorganics were within their historic ranges, and all were below Toxicity Characteristics.

VOCs, Phase IV Cell 2 Primary Leachate: VOC concentrations showed decreasing trends in May 2015. Acetone and 4-methyl-2-pentanone were detected at their lowest concentrations to date; there are no Toxicity Characteristics for these compounds, and they are routinely detected in this leachate. T-butanol decreased to within its historic range, after it was detected at its highest concentration in October 2014. 2-Butanone was detected at its lowest concentration to date, at well below its Toxicity Characteristic. 1,4-Dichlorobenzene was non-detected after its second detection in October 2014 (the first detection was in October 2013). All other VOCs were within their historic ranges, and all were below Toxicity Characteristics.

SVOCs, Phase IV Cell 2 Primary Leachate: SVOC concentrations showed decreasing trends in May 2015. 3&4-Methylphenol was detected at its lowest concentration to date; there is no Toxicity Characteristic, and it is routinely detected. Total cresol was detected at its lowest concentration to date, at well below its Toxicity Characteristic. All other SVOCs remain within their historic ranges, and all were below Toxicity Characteristics.

IV.G. Phase IV Cell 3A

Solid waste was being placed in Phase IV during the sampling round in May 2015. A sample of the primary Phase IV Cell 3 leachate was obtained at the primary leachate sampling port located in the Phase IV Cell 3 leachate house. Summary tables of results are in Appendix 1. None of the lab results for the May 2015 Phase IV Cell 3A primary leachate sample exceeded the VT Toxicity Characteristic concentrations.

INORGANICS, Phase IV Cell 3A Primary Leachate: Metals and other inorganics in the Phase IV Cell 3A primary leachate showed increasing trends in May 2015. Total cobalt (0.038 mg/L) and total vanadium (0.056 mg/L) were each detected for the first time since May 2012; there is no Toxicity Characteristic for these compounds. All other inorganic compounds were within their historic ranges, and all were below Toxicity Characteristics.

VOCs, Phase IV Cell 3A Primary Leachate: VOC concentrations showed generally increasing trends in May 2015. 1,4-Dichlorobenzene was detected for the fourth time since May 2013; it is well below its Toxicity Characteristic. On the other hand, methylene chloride was detected at its lowest concentration to date; there is no Toxicity Characteristic. All other VOCs were within their historic ranges, and all were below Toxicity Characteristics.

SVOCs, Phase IV Cell 3A Primary Leachate: SVOC concentrations showed increasing trends in May 2015. All SVOCs were within their historic ranges, and all were below Toxicity Characteristics.

IV.H. Combined Leachate Above-Ground Storage Tank

A leachate sample was collected from the combined leachate above-ground storage tank (AST) from piping used to fill leachate trucks. The liquid in this AST is a combination of Primary leachate and Secondary detection-system liquids from all of the phases and cells of the lined landfill. This combined-leachate AST represents an estimated 95% (+/-) primary leachate, per NEWSVT personnel. The sample was analyzed for total metals and other inorganics, volatile organics (by EPA Method 8260C), and semi-volatile organics (by EPA 8270C). Summary tables of results are in Appendix 1. None of the lab results for the May 2015 combined-leachate AST sample exceeded the VT Toxicity Characteristic concentrations.

INORGANICS, Combined Leachate in AST: Metals in the leachate AST showed mixed trends, and other inorganics showed decreasing trends in May 2015. Total cobalt (0.028 mg/L)

and total vanadium (0.037 mg/L) were detected for the first time since May 2012; they have no Toxicity Characteristics. TKN decreased to within its historic range, after it was detected at its highest concentration in October 2014. All other inorganic compounds were within their historic ranges, and all were below Toxicity Characteristics.

VOCs, Combined Leachate in AST: VOC concentrations showed increasing trends in May 2015. 4-Isopropyl-toluene increased to within its historic range after its lowest concentration in October 2014. Methylene chloride was non-detected after its second detection in October 2014 (its first detection was in May 2007). All other VOCs were within their historic ranges, and all were below Toxicity Characteristics.

SVOCs, Combined Leachate in AST: SVOC concentrations showed decreasing trends in May 2015. 3&4-Methylphenol and phenol were each detected at their lowest concentrations to date; they are both routinely detected, and have no Toxicity Characteristics. Naphthalene (10.8 mg/L) was detected for the first time; there is no Toxicity Characteristic. Total cresol was detected at its lowest concentration to date, at well below its Toxicity Characteristic. All other SVOCs remain within their historic ranges, and are well below Toxicity Characteristics.

V. STATISTICAL ANALYSES OF EXCEEDANCES OF GROUNDWATER STANDARDS

V.A. Statistical Analyses

Statistical analyses using EasyFit of 95% confidence intervals were calculated on normalized data (when normalization was possible). In instances where the raw data are not normal, three transformations were conducted (natural log, square root, and exponential). If the transformed data also are not normal, the statistical analyses are conducted on whichever data form is closest to normality, as indicated by the sum of the absolute values of skewness and kurtosis being closest to zero.

We have compared groundwater standards with the lower 95% confidence level for each chemical parameter in groundwater that has ever exceeded its VGES standard (currently sampled wells only). This statistical test determines whether the historical data for the well indicate a statistically significant exceedance of a groundwater standard, in accordance with Section 12-704(2) of the *Groundwater Protection Rule & Strategy*. Summary tables are included in Appendix 1, pages 11-14.

V.B. Preliminary Analysis of Cause and Significance

Arsenic, iron, lead and manganese levels statistically exceed groundwater standards in many of the up-gradient and down-gradient wells at NEWSVT. These dissolved metals are common naturally-occurring compounds in Vermont groundwater. However, the standards exceedances are generally greater in magnitude in the down-gradient wells, reflecting impacts from the

unlined landfill. Standards exceedances are also seen in a few of the up-gradient and down-gradient wells for three other metals (cadmium, mercury, and nickel). See the earlier discussions regarding trend evaluations, differentiating between impacts from the unlined versus lined areas, and the ongoing effort to evaluate the background concentrations at this site.

The statistical exceedances of groundwater standards for organic compounds in MW-A-1, MW-D-2 and MW-P2-R are likely the result of migration of leachate from the Unlined Landfill Areas A & B.

VI. QUALITY ASSURANCE/QUALITY CONTROL

Groundwater Samples QA/QC: Groundwater QA/QC Trip Blank #1 was provided by the laboratory, which was stored in the same cooler as the groundwater samples. Lab results showed no detections, indicating acceptable sampling and laboratory procedures for groundwater samples in the May 2015 sampling round. See the summary table in Appendix 1; laboratory results are in Appendix 2.

An Equipment Blank sample was collected from the groundwater sampling pump used for low-flow sampling of some of the deep monitoring wells. This pump requires decontamination between each well use. To decontaminate the pump between each use, a mixture of de-ionized water mixed with Alconox is run through the pump while it is turned on, followed by a rinse with de-ionized water. At the end of sampling use, the pump is placed into a cylinder filled with de-ionized water, and the Equipment Blank sample is collected for VOC analysis. Lab results showed no detections, indicating acceptable decontamination procedures. See the summary table in Appendix 1; laboratory results are in Appendix 2.

In May 2015, duplicate groundwater samples were collected from MW-103 (Dup 1), MW-804-SR (Dup 2), and MW-706 (Dup 3). The lab results for Dup-1, Dup-2 and Dup-3 were in close relation (concentrations in each duplicate pair had less than 45% relative differences).

Surface Water Samples QA/QC: A Surface Water QA/QC Trip Blank was provided by the laboratory, which was stored in the same cooler as the surface water samples. Lab results showed no detections, indicating acceptable sampling and laboratory procedures for surface water samples in the May 2015 sampling round. See the summary table in Appendix 1; laboratory results are in Appendix 2.

Underdrain Samples QA/QC: An Underdrain QA/QC Trip Blank was provided by the laboratory, which was stored in the same cooler as the underdrain samples. Lab results showed no detections, indicating acceptable sampling and laboratory procedures for underdrain samples in the May 2015 sampling round. See the summary table in Appendix 1; laboratory results are in Appendix 2.

Leachate Samples QA/QC: A Leachate QA/QC Trip Blank was provided by the laboratory, which was stored in the same cooler as the leachate samples. Lab results showed no detections, indicating acceptable sampling and laboratory procedures for leachate samples in the May 2015 sampling round. See the summary table in Appendix 1; laboratory results are in Appendix 2.

VII. GROUNDWATER DEPTHS, ELEVATIONS and FLOW DIRECTIONS

Depths to groundwater were measured in all groundwater monitoring wells (but not the drinking water wells). On the whole, water levels were generally higher in May 2015 than in October 2014. A summary table of the May 2015 groundwater elevations is included in Appendix 1, page 177. Tables and graphs of these measurements, showing all historic groundwater elevation data for each monitoring well, are included in Appendix 1, pages 178 - 202.

A groundwater elevation contour map, showing estimated horizontal groundwater flow directions in the surficial materials, is included in Appendix 1, page 2. This contour map is created by WHEM using water level data only from shallow surficial wells, in conjunction with surface water sampling elevations where available and appropriate. Water level data from bedrock wells and deep surficial wells are generally not used to create this map, since those data may not reflect the water table elevations at those locations.

VIII. SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

General:

1. Sampling was conducted on 5/4/15 through 5/6/15, by WHEM personnel in accordance with Conditions 46, 47 and 48 of NEWSVT's *Solid Waste Disposal Facility Certification* (effective October 18, 2010), and in accordance with SWMP's request to add MW-BRW-3S and 3D to this sampling round (per SWMP comment letter dated 1/28/2014).
2. All samples (groundwater, surface water including underdrains, and leachates) were analyzed by Endyne, Inc., of Williston, Vermont.
3. WHEM conducted low-flow sampling on all monitoring wells which had sufficient water, following WHEM's low-flow sampling SOP. Wells with insufficient water for low-flow sampling methodology were purged and sampled using dedicated hand bailers. Per the SOP, wells were field-measured for depth to water, pH, temperature, specific conductivity, dissolved oxygen, pH, oxidation reduction potential and turbidity until readings stabilized, or one-half hour passed whichever came first; and samples were then collected.
4. May 2015 trends in concentrations were visually estimated in comparison to the previous sampling event in October 2014.

Groundwater Summary:

5. Groundwater, Up-gradient of Lined and Unlined Landfills; Inorganics: In the May 2015 sampling round, inorganic compounds showed upward trends in DW-21 (Office), MW-801D-R the St. Onge well, BRW-3S and BRW-3D; while downward trends were noted in MW-409, MW-705, MW-706, 801BR-R and MW-804SR.

6. Groundwater, Up-gradient of Lined and Unlined Landfills; Organics: In May 2015, there were no VOCs detected in the up-gradient wells (DW-21 (Office), St. Onge well, MW-409, MW-705, MW-706, MW-801D-R, 801BR-R, MW-804S-R, MW-BRW-3S, and MW-BRW-3D.
7. Groundwater, Down-gradient from Unlined Areas A & B; Inorganics: In the May 2015 sampling round, inorganic compounds showed upward trends in MW-A1, MW-B1, MW-P2R, and MW-P8. Downward trends were noted in MW-D1R, MW-D2, MW-P5 and MW-412R. In February 2015, a downward trend was noted in BRW-1 and BRW-2R.
8. Groundwater, Down-gradient from Unlined Areas A & B; Organics: Groundwater samples are analyzed for VOCs by EPA Method 8260C. Seven of the ten wells located down-gradient from the Unlined Areas A & B showed no detectable VOCs in May 2015 (MW-B1, MW-D1R, MW-P5, MW-P8 and MW-412R). BRW-1 and BRW-2 were both non-detected for VOCs (and SVOCs) in February 2015. In the May 2015 sampling round, organic compounds showed upward trends in MW-D2, and downward trends were noted in MW-A1 and MW-P2R.
9. Groundwater, Down-gradient of lined Phases I-IV and Not Impacted by Unlined Areas A & B; Inorganics: In the May 2015 sampling round, inorganic compounds showed upward trends in MW-P6 and MW-805S. Downward trends were noted in MW-E1, MW-103 and MW-703.
10. Groundwater, Down-gradient of lined Phases I-IV and Not Impacted by Unlined Areas A & B; Organics: Groundwater samples are analyzed for VOCs by EPA Method 8260C. MW-E1, MW-P6, MW-103, MW-703 and MW-805S were all non-detected for VOCs.
11. Groundwater Between Unlined Areas A & B, and Lined Phases I and II: There is now one compliance monitoring well (MW-F1) between the lined and unlined landfills. During the fall of 2013, NEWSVT excavated solid waste and soils in this zone, including at the location of two previous compliance monitoring wells (MW-2R, MW-410R). These wells were found to be constructed in or through solid waste, so they were decommissioned. Replacement well MW-F1 was installed in April 2015 in this zone, and it was sampled for the first time in May 2015. Lab results indicated elevated metals, as well as VOC detections, indicating that, despite the clean fill placed in this excavation, groundwater at this well continues to be impacted by leachate from Unlined Areas A & B.

12. Unusual values in groundwater results in May 2015:

12.A. Highest detections to date; values exceed Primary GESs:

- MW-P2R: Total Chromium, Total Nickel.
- MW-D2: Total Arsenic.
- BRW-3D: Total Arsenic.

12.B. Second Highest detections; values are below Primary GESs:

- MW-705: Total Sodium (since May 2011).
- BRW-1: Total Sodium (since March 2006).

12.C. Highest detections to date; values exceed Secondary GESs:

- MW-801D-R: Total Manganese (second highest concentration since May 2008).
  Dissolved Manganese.
- St. Onge: Total Iron (highest concentration since May 2009).
- D2: Total Chloride.
- MW-P2R: Total Iron.
- BRW-2: Dissolved Iron.

12.D. Highest detections to date; values are below Secondary GESs:

- MW-705: Total chloride.
- St. Onge: Dissolved Iron (second highest concentration since October 2010).
- MW-A1: Total Chloride (second highest concentration since May 2014).
- MW-409: Total Chloride.
- BRW-1: Total Chloride.

12.E. Highest detections to date; parameters have no GESs:

- MW-D2: 2-methyl-2-pentanone (MIBK).

12.F. Lowest detections to date, or first-time non-detections:

- MW-801BR-R: Total Sodium (below primary GES).
- MW-412R: Dissolved Manganese (non-detect for the first time).
  Total Sodium (lowest concentration to date; below primary GES).
  Total Chloride (lowest concentration to date; below secondary GES).
- BRW-3S: Total Sodium (lowest concentration to date; and below primary GES).
- BRW-1: Total Manganese (lowest concentration to date; still exceeds primary GES).
  Dissolved Manganese (lowest concentration to date; still exceeds primary GES).
  Total Iron (lowest concentration to date; still exceeds secondary GES).
- BRW-3D: Dissolved Manganese (non-detect for the first time).
  Total Sodium (lowest concentration to date; and below primary GES).
- MW-E1: Total Arsenic (lowest concentration to date; and below primary GES).
  Total Iron (lowest concentration to date; still exceeds secondary GES).
  Total Sodium (lowest concentration to date; and below primary GES).
- MW-P8: Total Nickel (non-detected for the first time since October 2001).

13. Arsenic, iron, lead and manganese levels statistically exceed groundwater standards in many of the up-gradient and down-gradient wells at NEWSVT. These dissolved metals are common naturally-occurring compounds in Vermont groundwater. However, the standards exceedances are generally greater in magnitude in the down-gradient wells, reflecting

impacts from the unlined landfill. Standards exceedances are also seen in a few of the up-gradient and down-gradient wells for three other metals (cadmium, mercury, and nickel). Long-term trend evaluations are underway at present, in an effort to differentiate between natural and anthropogenic impacts (both direct and indirect) at this site.

14. The statistical exceedances of groundwater standards for organic compounds in MW-A1, MW-D2 and MW-P2-R are likely the result of migration of leachate from the Unlined Landfill Areas A and B.
15. Groundwater levels across the site were generally higher in May 2015 than in October 2014. All groundwater depths were within historical ranges. Groundwater flowpaths are generally to the west and northwest in the vicinity of lined Phases III and IV; to the north in the vicinity of lined Phase II, and to the northwest, north and northeast in the vicinity of lined Phase I and Unlined Areas A & B.
16. No drinking water supplies are impacted by the NEWSVT facility.

Surface Water Summary:

1. There are two upstream and six downstream surface water sampling locations at NEWSVT (in addition to the four underdrain outlets, which are summarized separately, below).
2. Inorganics concentrations at the surface water sampling locations did not show consistent trends in May 2015 compared to October 2014. As has been the case in previous years, Vermont Water Quality Standards were generally not exceeded, with the exception of iron in SW-4 and SW-6; arsenic in SW-3, SW-6, and SW-7; lead in SW-6 and SW-8; and nickel in SW-6.
3. At all surface water locations, there were possible technical exceedances of the surface water standards for cadmium, chromium, copper, lead, nickel and zinc because the lab's detection levels are higher than the date-specific hardness-dependent calculated standards for those parameters. Many of the possible standards exceedances mentioned in this report have not been seen in the past when results were compared to the former standards, but the new standards (effective October 30, 2014) have new hardness-dependent formulas for determining some of the metals standards.
4. Volatile Organic Compounds and Semi-Volatile Organic Compounds continued to be non-detected in May 2015 at all surface water sampling locations, as in the past.

Underdrains Summary:

1. There are four independent underdrain systems beneath the lined landfills at NEWSVT (one for each Phase). They consist of perforated pipes bedded in high-permeability drainage sand and stone located either in trenches or a continuous blanket beneath or within the engineered soil drainage system. The purpose of the underdrain systems is to isolate the lined landfills from groundwater, and to discharge the intercepted groundwater by gravity flow at separate locations on the lower slopes around the margins of the landfill.
2. NEWSVT personnel reported that the underdrain pipes were last flushed on September 23, 2014, and are scheduled to be flushed again in July or August 2015.

3. Inorganics concentrations at the underdrain discharges did not show consistent trends in May 2015 compared to October 2014. As has been the case in previous years, Vermont Water Quality Standards were generally not exceeded, with the exception of nickel in the Phase I and Phase 2 discharges; and arsenic in the Phase 2, Phase 3 and Phase 4 underdrain discharges.
4. In all underdrain discharges, there were possible technical exceedances of the cadmium, chromium, copper, lead, nickel and zinc standards because the lab's detection levels are higher than the date-specific hardness-dependent calculated standards for those parameters. Many of the possible standards exceedances mentioned in this report have not been seen in the past when results were compared to the former standards, but the new standards (effective October 30, 2014) have new hardness-dependent formulas for determining some of the metals standards.
5. The temperature of the discharge from the Phase III Underdrain (UD-3) has been rising since approximately 2006, and was 20.4 deg. C in May 2015. This may be the reason that the temperature in SW-7 (the surface water sampling station located about 500 feet downstream from where the flow from UD-3 enters this small stream) was near the upper end of its typical range in May 2015 (12.4 deg. C). Temperatures at these two locations are substantially higher than at other similar locations at this site. Brian Beaudoin, Project Engineer (Sanborn, Head & Associates) has reviewed these data and the engineering literature on elevated temperatures in landfills. He indicates that the most likely reason for the elevated temperatures in the Phase III underdrain discharge is the heat of decomposition within the solid waste in Phase III. This indication is supported by the similarly rising leachate temperatures that WHEM staff have recorded in semi-annual samples of Primary Leachates from Phase III Cells 1 and 2. See Recommendation #6.
6. The May 2015 sampling results of the other three underdrain discharges give no indications of significant landfill impacts.

<u>Leachate Summary:</u>

1. Solid waste was being placed in Phase IV during the sampling round in May 2015.
2. Eight leachate samples were collected on May 8, 2015; seven from the primary leachate collection systems of individual phases of the lined landfill, and one sample from the combined-leachate above-ground storage tank (AST). No samples were collected from the secondary leak-detection systems of individual phases of the lined landfill, per instructions from NEWSVT personnel.
3. Leachate samples from the seven individual phases of the landfill showed values generally within historical ranges, with no exceedances of the VT Toxicity Characteristics.
4. Results from the combined leachate AST tank were within historic ranges, with no unusual occurrences and no exceedances of the VT Toxicity Characteristics.

Trip Blank and Equipment Blank QA/QC Samples:

1. QA/QC trip blank samples were provided by the laboratory, and were stored in the same cooler as the groundwater samples, surface water samples, underdrain samples and leachate samples. The lack of detections of VOCs in these trip-blank samples indicated acceptable sampling and laboratory procedures for the May 2015 sampling round. The QA/QC equipment blank sample collected by WHEM from the low-flow sampling pump also had no VOC detections, indicating acceptable sampling and laboratory procedures in May 2015. The three duplicate groundwater samples showed results that were in close relation (concentrations in each duplicate pair had less than 45% relative differences).

Based on this Report including the Summary and Conclusions above, WHEM makes the following Recommendations:

1. Groundwater monitoring wells should continue to be sampled utilizing low-flow technology during the next semi-annual sampling event in October 2015 (and all future sampling rounds) for wells with enough water to be appropriately sampled by this method.
2. During future sampling events, efforts will continue to minimize collection of high silt/sand groundwater samples, such as bailing known silty wells first, as soon as we arrive on-site. This will allow the wells to settle for as long as possible and these samples will be collected last.
3. Monitoring should continue as it has in the past, in accordance with the currently approved schedule (semi-annual monitoring of groundwater and surface waters, quarterly monitoring of leachates), with the exception mentioned in Recommendation #4 below.
4. MW-BRW-3S and MW-BRW-3D should be deleted from the semi-annual monitoring network and report beginning with the October 2015 sampling round. This is because groundwater elevation data indicate that these two wells are not down-gradient of the lined or unlined landfill facilities at NEWSVT. Rather, these two wells are side-gradient from the landfill activities, and are likely to be susceptible to impacts from other much closer upgradient sources such as Airport Road. As such, they do not appropriately belong in the compliance monitoring network for this landfill.
5. A trend analysis of three parameters that routinely exceed their primary Groundwater Enforcement Standards (GES; Dissolved Arsenic, Iron and Manganese) is being conducted, as was indicated in our Fall 2014 WQ Monitoring Report and as has been requested by the Solid Waste Program. We are in the process of gathering and graphing all of those data from the earliest times of record for all monitoring locations throughout the site. We anticipate completing this more detailed analysis of trends for these three parameters by the end of summer 2015.
6. Elevated Arsenic concentrations in MW-BRW-9S have been evaluated, and is addressed in a separate report that will be submitted to the SWP under separate cover.

7. The rising temperature of the discharge from the Phase III Underdrain (UD-3), and in SW-7 (the surface water sampling station located about 500 feet downstream from where the flow from UD-3 enters this small stream), and in leachate from Phase III Cells 1 and 2 merits continued attention in the future.

Sincerely,

Wendy Krembs

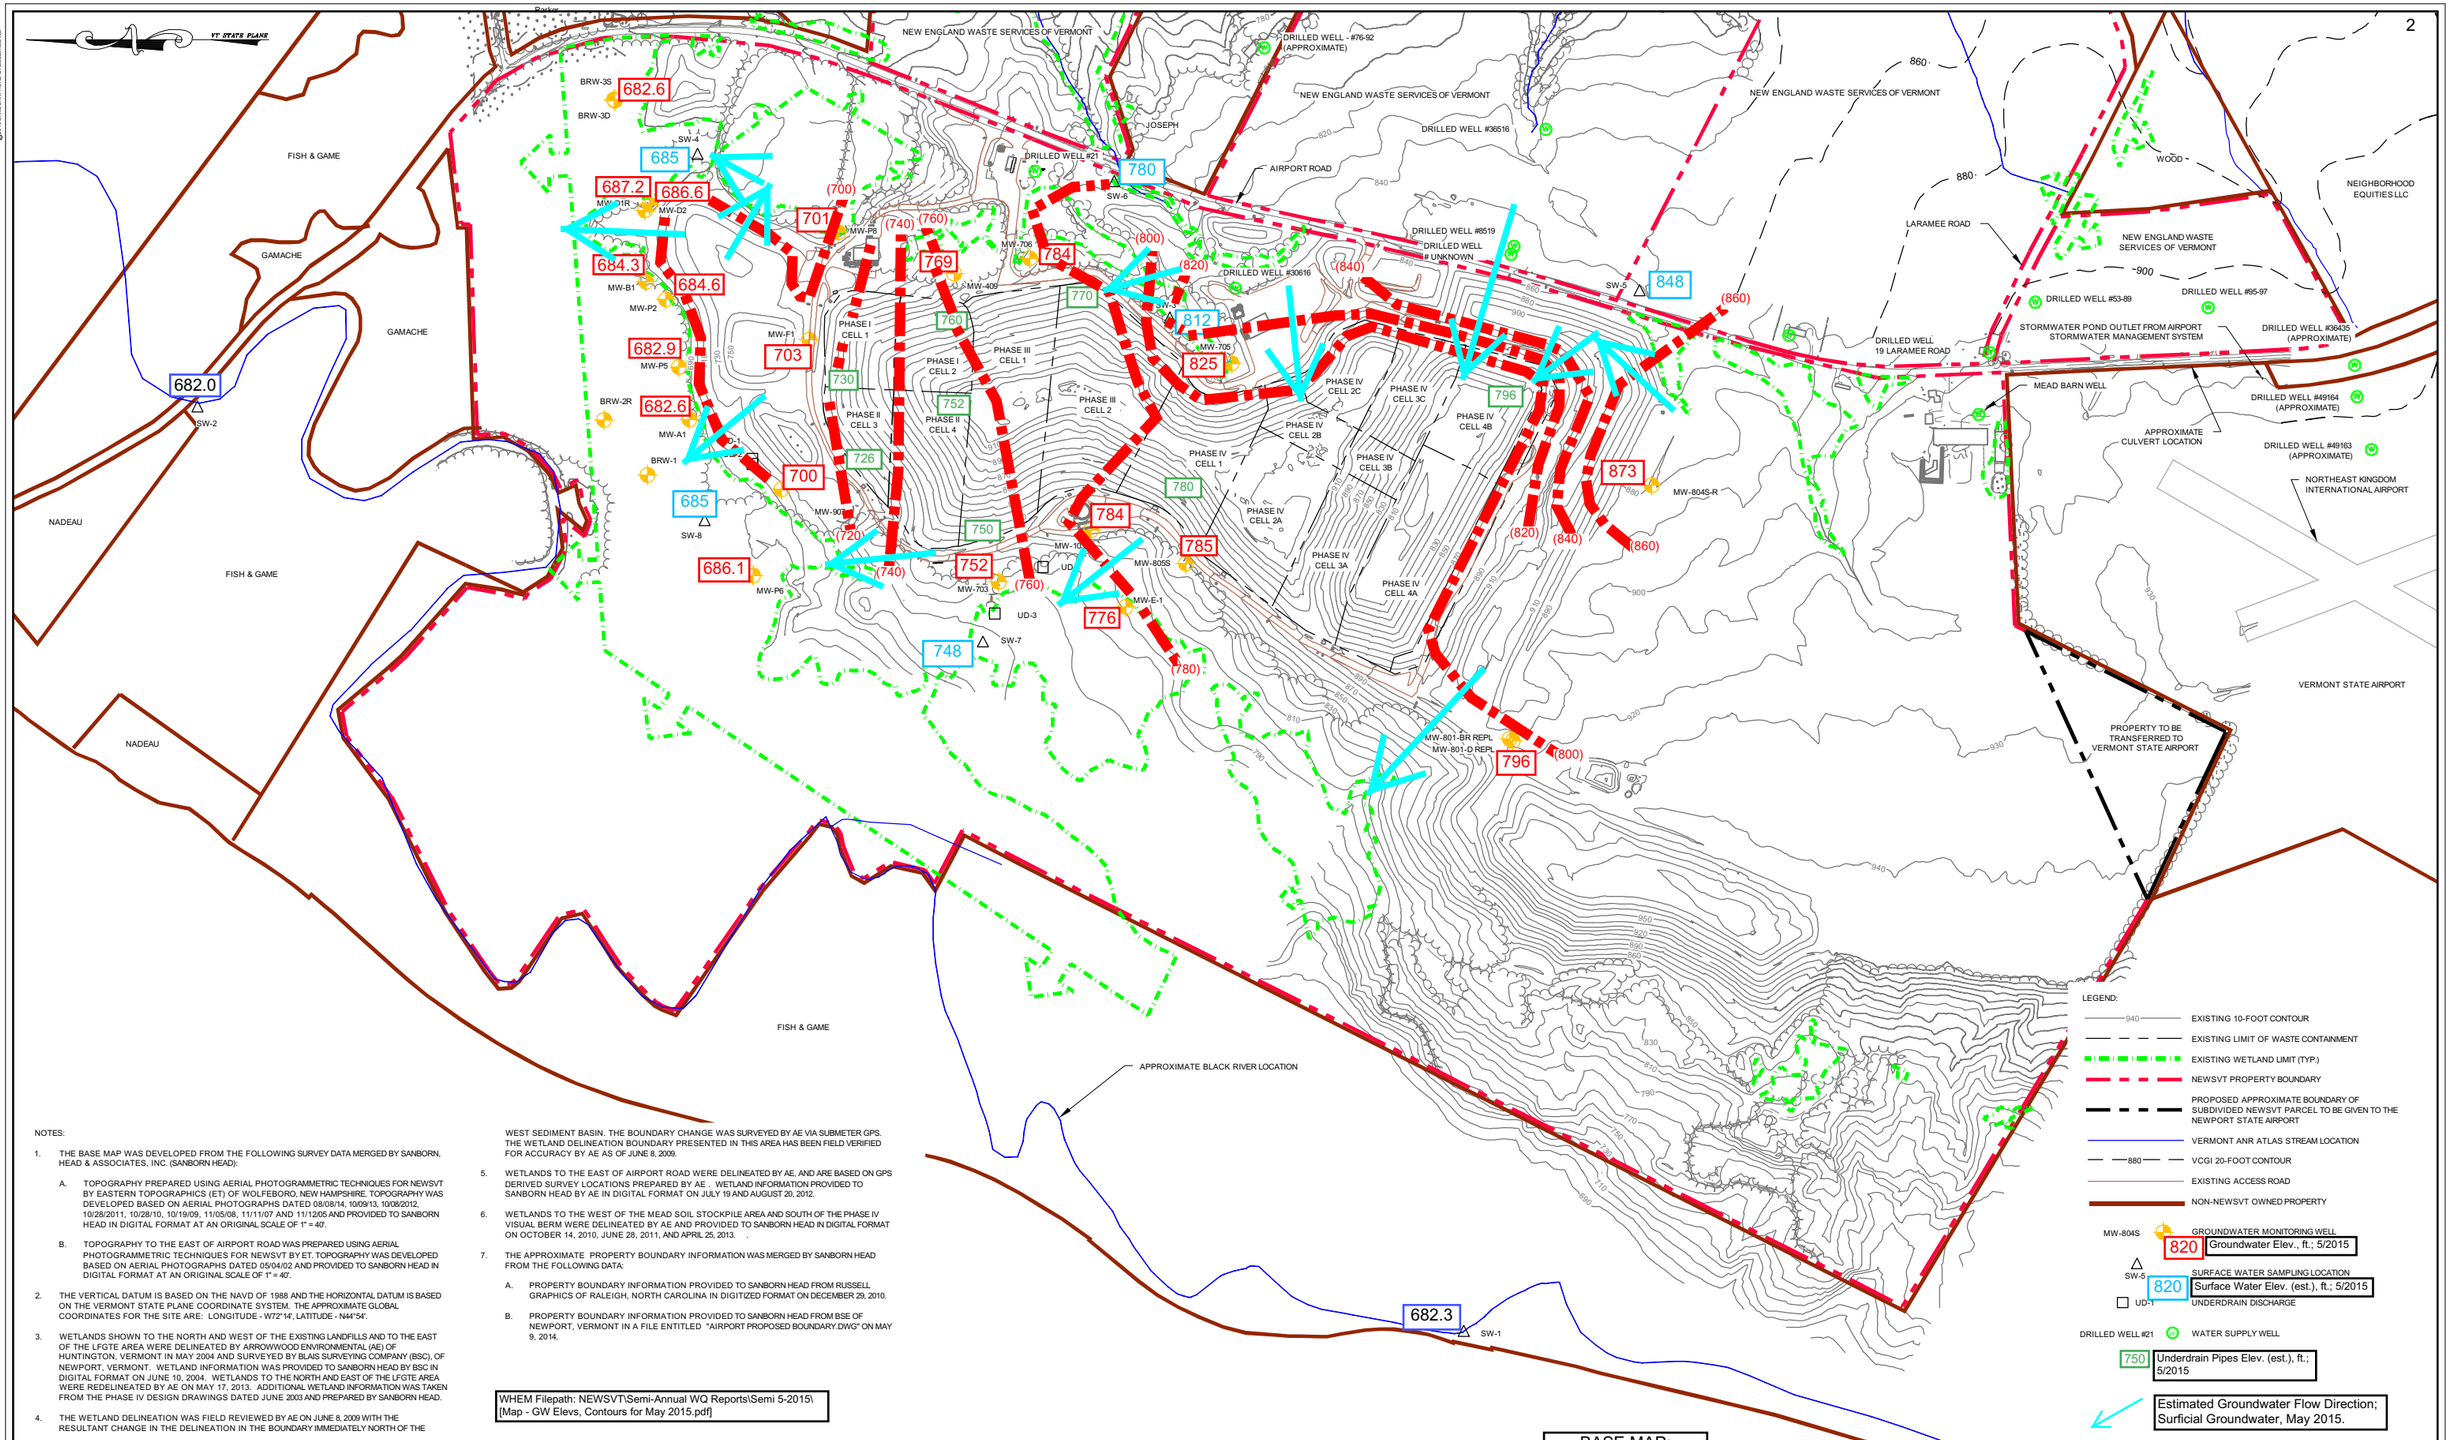
WATER QUALITY MONITORING LOCATIONS MAP

PROJECT NUMBER: 1166.08

SHEET NUMBER: 1



NOTES:

1. THE BASE MAP WAS DEVELOPED FROM THE FOLLOWING SURVEY DATA MERGED BY SANBORN, HEAD & ASSOCIATES, INC. (SANBORN HEAD):
   A. TOPOGRAPHY PREPARED USING AERIAL PHOTOGRAMMETRIC TECHNIQUES FOR NEWSVT BY EASTERN TOPOGRAPHICS (ET) OF WOLFEBORO, NEW HAMPSHIRE. TOPOGRAPHY WAS DEVELOPED BASED ON AERIAL PHOTOGRAPHS DATED 08/08/14, 10/09/13, 10/08/2012, 10/28/2011, 10/28/10, 10/19/09, 11/05/08, 11/11/07 AND 11/12/05 AND PROVIDED TO SANBORN HEAD IN DIGITAL FORMAT AT AN ORIGINAL SCALE OF 1" = 40'.
   B. TOPOGRAPHY TO THE EAST OF AIRPORT ROAD WAS PREPARED USING AERIAL PHOTOGRAMMETRIC TECHNIQUES FOR NEWSVT BY ET. TOPOGRAPHY WAS DEVELOPED BASED ON AERIAL PHOTOGRAPHS DATED 05/04/02 AND PROVIDED TO SANBORN HEAD IN DIGITAL FORMAT AT AN ORIGINAL SCALE OF 1" = 40'.
2. THE VERTICAL DATUM IS BASED ON THE NAVD OF 1988 AND THE HORIZONTAL DATUM IS BASED ON THE VERMONT STATE PLANE COORDINATE SYSTEM. THE APPROXIMATE GLOBAL COORDINATES FOR THE SITE ARE: LONGITUDE - W72°14', LATITUDE - N44°54'.
3. WETLANDS SHOWN TO THE NORTH AND WEST OF THE EXISTING LANDFILLS AND TO THE EAST OF THE LFGTE AREA WERE DELINEATED BY ARROWWOOD ENVIRONMENTAL (AE) OF HUNTINGTON, VERMONT IN MAY 2004 AND SURVEYED BY BLAIS SURVEYING COMPANY (BSC), OF NEWPORT, VERMONT. WETLAND INFORMATION WAS PROVIDED TO SANBORN HEAD BY BSC IN DIGITAL FORMAT ON JUNE 10, 2004. WETLANDS TO THE NORTH AND EAST OF THE LFGTE AREA WERE REDELINEATED BY AE ON MAY 17, 2013. ADDITIONAL WETLAND INFORMATION WAS TAKEN FROM THE PHASE IV DESIGN DRAWINGS DATED JUNE 2003 AND PREPARED BY SANBORN HEAD.
4. THE WETLAND DELINEATION WAS FIELD REVIEWED BY AE ON JUNE 8, 2009 WITH THE RESULTANT CHANGE IN THE DELINEATION IN THE BOUNDARY IMMEDIATELY NORTH OF THE WEST SEDIMENT BASIN. THE BOUNDARY CHANGE WAS SURVEYED BY AE VIA SUBMETER GPS. THE WETLAND DELINEATION BOUNDARY PRESENTED IN THIS AREA HAS BEEN FIELD VERIFIED FOR ACCURACY BY AE AS OF JUNE 8, 2009.
5. WETLANDS TO THE EAST OF AIRPORT ROAD WERE DELINEATED BY AE, AND ARE BASED ON GPS DERIVED SURVEY LOCATIONS PREPARED BY AE . WETLAND INFORMATION PROVIDED TO SANBORN HEAD BY AE IN DIGITAL FORMAT ON JULY 19 AND AUGUST 20, 2012.
6. WETLANDS TO THE WEST OF THE MEAD SOIL STOCKPILE AREA AND SOUTH OF THE PHASE IV VISUAL BERM WERE DELINEATED BY AE AND PROVIDED TO SANBORN HEAD IN DIGITAL FORMAT ON OCTOBER 14, 2010, JUNE 28, 2011, AND APRIL 25, 2013. .
7. THE APPROXIMATE PROPERTY BOUNDARY INFORMATION WAS MERGED BY SANBORN HEAD FROM THE FOLLOWING DATA:
   A. PROPERTY BOUNDARY INFORMATION PROVIDED TO SANBORN HEAD FROM RUSSELL GRAPHICS OF RALEIGH, NORTH CAROLINA IN DIGITIZED FORMAT ON DECEMBER 29, 2010.
   B. PROPERTY BOUNDARY INFORMATION PROVIDED TO SANBORN HEAD FROM BSE OF NEWPORT, VERMONT IN A FILE ENTITLED "AIRPORT PROPOSED BOUNDARY.DWG" ON MAY 9, 2014.

RE: New England Waste Services Spring 2014 Semi-Annual Water Quality Monitoring and Down-Gradient Property Boundaries Reports

Mr. Gay,

The Solid Waste Management Program (SWMP) has received and reviewed both the Spring 2014 Semi-Annual Water Quality Monitoring Report and the Groundwater Quality at Down-Gradient Property Boundaries Report prepared by Waite-Heindel Environmental Management (WHEM) on behalf of New England Waste Services of Vermont (NEWSVT). The semi-annual groundwater and surface water monitoring and reporting is required by NEWSVT's Solid Waste Facility certification and this submission is in compliance with Conditions 46-48 and 55-56. The well installation, monitoring and reporting at the property boundary was performed in an effort to demonstrate compliance with the Groundwater Protection Rule and Strategy and Public Trust Doctrine.

Semi-annual Groundwater Monitoring
Thank you for generally addressing the comments presented in the review letter in response to the Fall 2013 semi-annual report. However, there are several comments and remaining or new considerations which may require further attention prior to the Fall 2014 reporting.

Discussion of Sampling Results

A. In the eight up-gradient monitoring wells exceedances of the Vermont Groundwater Enforcement Standards (VGES) were reported for As, Mn and Fe. Many of the detected concentrations were significantly lower during this sampling round in comparison to the October 2013 sampling period. No volatile organic compounds (VOCs) were detected in any up-gradient wells. These exceedance levels for inorganics in up-gradient wells indicate some elevated background concentrations in the region; however, the concentrations are lower than the detected down-gradient concentrations indicating some landfill impact.

B. VOC concentrations above the VGES were detected in three monitoring wells (MW-A1, MW-D2 and MW-P2R). These three wells are all located in near vicinity to the unlined landfill (between 200 and 400 feet from landfill edge) and historically have had comparable VOC concentrations. Only one other well reported a VOC detection, though well below enforcement standards. This low level detection of total xylenes (5 ppb) in MW-103 is not the first detection of VOCs in

this monitoring well (2012-benzene and MEK; 2009-acetone), though concentrations have always been significantly below standards.

C. Conclusion 11 for the groundwater sampling states: ". . . However, the standards exceedances are generally greater in magnitude in the down-gradient wells, reflecting likely impacts from the unlined landfill." While the SWMP does not disagree that this statement may be relevant to the down-gradient wells that indicate some of the highest contaminant concentrations, it does not encompass all of the down-gradient wells at the site with contamination. MW-E1 is an example of a down-gradient well that is not in direct connection with the unlined landfill, which has fluctuating contaminant concentrations and exceedances. In the last year this well has had exceedances for As, Fe and Mn, the most common contaminants at the site, but also Pb and Cd. The detected contaminants that cannot be directly related to the unlined landfill need to be discussed more thoroughly within the water quality reports.

D. Conclusion 2 for the surface water sampling states: ". . . Vermont Water Quality Standards were generally not exceeded, with the occasional exception of the Iron standard at a few locations, . . ." The summary of detections in the reports states that arsenic was detected above the VWQS in three of the six surface water sampling locations (SW-3, SW-6 and SW-7). Though the arsenic exceedances are more sporadic than the iron, they are significant and do inform us about water quality, please more clearly address all surface water exceedances in future reports.

General Comments:

1. In November and December of 2013, excavations were made to remove waste between the unlined and Phase I and Phase II landfills. During this work, MW-2R and MW-410R were determined to be unviable given their proximity to waste and were decommissioned. Discussions since this decommissioning have occurred between NEWSVT and the SWMP regarding whether a replacement well would be required to be reinstalled as per the submitted work plan, or if replacement was unnecessary given the incomplete removal of waste and the inability to fully identify the waste boundaries in the region between the lined and unlined landfills. To date, a determination has been not made regarding this matter. It is the SWMP position that a replacement well would provide valuable information regarding the buffer-zone between the unlined and lined landfills should further contamination ever be detected in down-gradient wells. It was our understanding that WHEM was going to explore whether or not replacement of a well in the general vicinity between the lined and unlined landfill would be of beneficial use for the long-term monitoring of this site and to suggest a course of action.

2. The semi-annual monitoring reports often refer to specific contaminants or wells as having 'generally increasing/decreasing trends'. It is unclear what is represented by these temporal trends. Please clarify in future reports what is intended by these statements. Are these trends calculated temporal trends, visual trend estimates and/or determined over the whole sampling period, the most recent sampling period or only in comparison to the last sampling round?

3. Turbidity is discussed as being measured to stabilization, as a SOP parameter, in order to determine sufficient flushing prior to obtaining a sample. Please report this stabilized turbidity reading within the monitoring reports as it may inform some of the high metal concentrations.

Groundwater Quality at Down-Gradient Property Boundaries; NEWSVT Report

This work is not part of the semi-annual water quality monitoring required by the certification, rather it was completed to demonstrate compliance with the Groundwater Protection Rule and Strategy as part of the pending recertification for the landfill. This work added six new monitoring wells along the landfill property boundary which has been identified as the point of compliance. These new wells were sampled throughout the spring of 2014, overlapping with the period of the Semi-Annual Water Quality monitoring event discussed above.

Discussion of Results:

A. During the initial sampling rounds of the new monitoring wells volatile organic compounds and semi-volatile organic compounds were analyzed for in all samples. As all contaminants were non-detect in all samples, VOC and SVOC sampling was not required in further monitoring events. This is particularly informative for BRW-4S and BRW-5S which are down-gradient to side-gradient of the unlined landfill and the wells that do regularly report VOC contamination.

B. The ability to include the groundwater elevations from the nine new landfill distal monitoring wells allowed for the groundwater flow paths to be better defined for this site. This was particularly informative for the northeasterly corner of the property where the redefined flow paths indicate that the groundwater flow path length from the unlined landfill to the property boundary and the Black River is longer than previously anticipated due to a hydraulic barrier which apparently concentrates flow to the west and towards BRW-5S. Flow direction is also complicated in the northwestern portion of the property, near BRW-7S, where the low gradient across these broad, flat wetlands makes it difficult to determine true flow direction.

C. The three contaminants of primary concern for this site, As, Fe, Mn were detected in the compliance point monitoring wells. Arsenic was detected in one of the monitoring wells above the PGES, while iron was detected above the SGES in all of the wells and Mn was detected above the PGES in all but one of the monitoring wells. Total and dissolved Fe and Mn was both analyzed for within this sampling round and results show that the dissolved phase is the dominant phase present in the groundwater at the property boundary.

Comments and Continued Work:

1. I was unable to locate the measured field parameters for the individual monitoring wells with this report. Please submit these measured parameters (pH, specific conductivity, turbidity etc.) in future reports related to monitoring of these wells.

2. The report points to lowered dissolved oxygen, and acidic conditions within the wetlands monitoring wells in comparison to upland wells as evidence of the naturally reducing conditions within the wetlands (pg. 4)

3. The elevated arsenic concentrations within BRW-9S is puzzling. The average of 46 µg/l is significantly higher than any other measured arsenic concentrations on the site. The fact that arsenic has been detected in the up-gradient wells (St. Onge bedrock well at 11 µg/l in May 2014) does indicate that there is natural arsenic present in the background conditions. The additional fact that arsenic is detected at lower concentrations between BRW-9S and the landfill (e.g. MW-E1 and MW-703) is indicative of the elevated arsenic concentrations at this down-gradient point being unusual, though there are no monitoring wells truly located along the direct groundwater flow path from the landfill to BRW-9S. In an April 17, 2014 quarterly meeting between NEWSVT staff, consultants and the SWMP, there was some discussion of a disturbance in the vicinity of BRW-9S potentially related to historic gravel

excavation or automotive disposal. This disturbance was not mentioned in the submitted report, but may influence the interpretation of contaminant concentrations at BRW-9S. It will need to be better demonstrated that the elevated arsenic concentrations are anomalous, localized and unrelated to landfill impact. This may involve the installation of another up-gradient monitoring well in the enar vicinity of BRW-9S for comparison or more exploration of the area and geochemical conditions to identify potential sources of arsenic within this well.

4. The Groundwater Protection Rule and Strategy states that prior to issuing a permit for a regulated activity in a Class III groundwater area, a finding must be made that the activity "i) will not cause the groundwater quality to reach or exceed the primary enforcement standards at a compliance point; ii) it will not cause the groundwater quality to reach or exceed the secondary enforcement standards or 110% of the secondary background groundwater quality established under 12-704, whichever is greater, at a compliance point".

   This work will contribute to this finding; however, it does not yet fully address the issue of background concentrations for this site. This initial work has demonstrated that groundwater concentrations for Fe, Mn and As are above the primary enforcement standards at the compliance point of the property boundary. However, it also implies that these concentrations are likely attributed to the wetland conditions and background concentrations. This is supported by the elevated Fe and Mn concentrations in BRW-10S, a background well, and the fact that the new Black River well Fe and Mn concentrations are significantly higher than the landfill proximal down-gradient wells which would be intercepting any landfill impacted groundwater. However, the report does not attempt to determine or suggest possible background concentrations for the site. I realize that this matter is complicated by the varying hydrologic environments (wetlands down-gradient and moderate draining uplands) present across the site as a whole and the general ambiguity regarding the determination of background water quality within the Groundwater Protection Rule and Strategy. However, an attempt to resolve the issue of defining background must be made.

Please do not hesitate to contact me if you have any questions on any of the above comments and recommendations. I can be reached at (802) 522-0561 or kasey.kathan@state.vt.us

RE: New England Waste Services Fall 2014 Semi-Annual Water Quality Monitoring Report

Mr. Gay-

The Solid Waste Management Program (SWMP) has received and reviewed the Fall 2014 Semi-Annual Water Quality Monitoring Report prepared by Waite-Heindel Environmental Management (WHEM) on behalf of New England Waste Services of Vermont (NEWSVT). The semi-annual groundwater and surface water monitoring and reporting was received December 9, 2014 is required by NEWSVT's Solid Waste Facility certification and this submission is in compliance with Conditions 46-48 and 55-56.

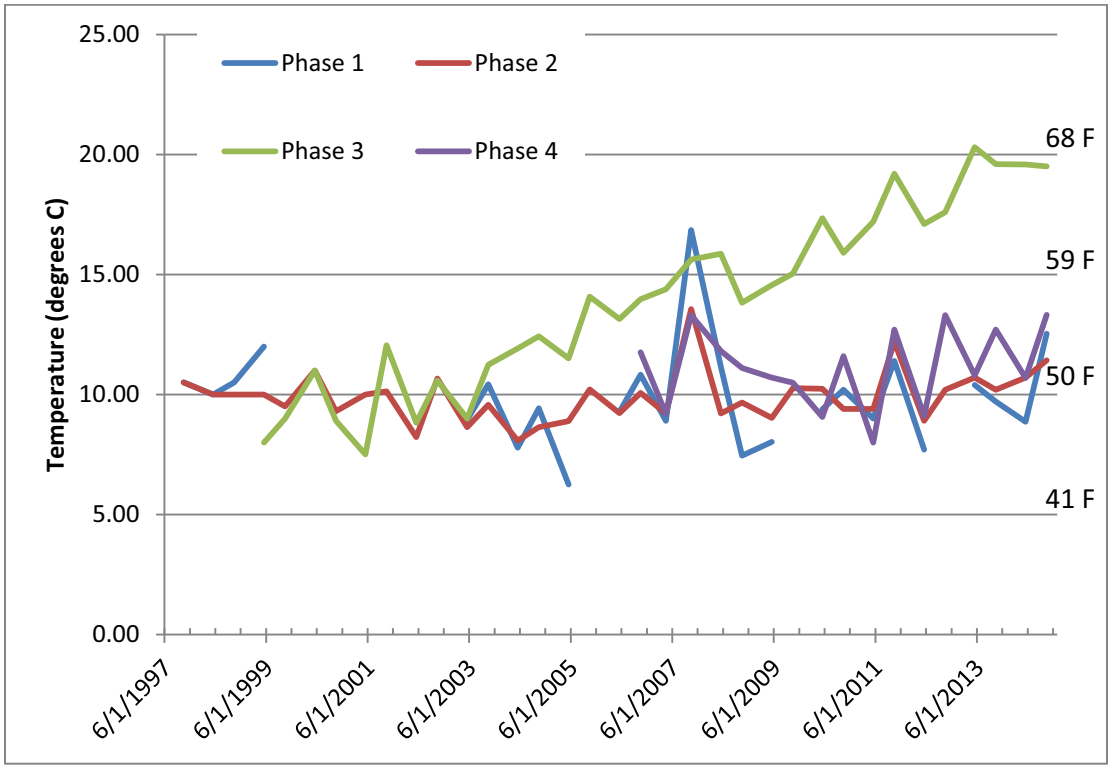
This most recent monitoring report supports previous monitoring results and reports from this site. Evidence of landfill impact is principally concentrated to groundwater monitoring wells located down-gradient of the unlined landfill (Areas A & B). This impact includes both inorganic and organic components with mixed (decreasing and increasing) trends observed across numerous monitoring wells.

As outlined in the monitoring report and discussed at the December 23, 2014 quarterly facility meeting, I appreciate your clarification of the use of trends within the report. The visual comparison to the previous sampling event for the purpose of comparison within the semi-annual reports is reasonable; it primarily helps to be clear that we are all at the same understanding. I do believe that the longer trend analysis of the primary contaminants of concern for the site will be useful in determining what appropriate background concentrations may be for this site.

Exceedances that are down-gradient of the lined landfill are primarily limited to secondary exceedances for inorganics. The primary exception is within wells MW-703 where there is a primary exceedance for manganese. It is encouraging to see that the improved sampling techniques at MW-805S continue to results in reductions in inorganic concentrations within the samples and that MW-103 samples were non-detect for volatile organic compounds following low level detections in May 2014.

An item of consideration remains the elevated arsenic concentrations detected at the surface water sampling location, SW-7. SW-7 does lie downstream of the underdrain discharge points for UD-3 and UD-4 and the water quality and condition at this surface water location likely reflects the groundwater intercepted by the underdrains. However, the arsenic concentrations detected in the underdrain water typically has a lower arsenic concentration than that of SW-7, and the elevated temperature and arsenic concentrations from these locations, in comparison to the other

underdrains and surface water locations, remains difficult to explain. Temperature within the Phase III underdrain has been increasing steadily with only minor seasonal air temperature fluctuations since 2003. This is despite having a temperature profile comparable to the other site underdrains prior to this point and no significant shift in operations at that time.



In light of the elevated arsenic concentrations within the compliance Black River wetland well BRW-9S and the potential up-gradient to cross-gradient positioning of SW-7 and the Phase III Underdrain relative to this location, these relationships and elevated arsenic concentrations bear further consideration moving forward. In combination with the background trend work currently being completed, this may provide an important context for interpreting the sources (natural vs. impacted) of inorganics down-gradient of the lined landfill.

Please do not hesitate to contact me if you have any questions at (802) 522-0561 or kasey.kathan@state.vt.us

Re: Replacement wells between lined and unlined landfills

Dear Joe-

Thanks you for the submission of the generalized work plan for the installation of a replacement well between Phases I-II lined landfill and unlined Areas A-B. This work plan was received by the Solid Waste Management Program (SWMP) on November 26, 2014. The installation of this replacement well was first discussed in the initial Exploration and Restoration Plan submitted on July 29, 2013.

The proposed replacement well, MW-F1, is suggested for installation on the north side of the perimeter road to a depth below ground surface of approximately 42 feet. The SWMP agrees that the proposed well construction and location are reasonable and will provide sufficient similarity to the decommissioned MW-2R and MW-410R. The SWMP also agrees with the purpose of this replacement well as outlined in the proposal. Future results obtained from MW-F1 can only be directly compared to results as measured within that well (from installation going forward). However, the historical context of what we know about this location from the previous results of MW-2R and MW-410R and the results of the exploration and excavation work completed in 2013 will certainly continue to contribute to our understanding of this particular location and the results obtained from MW-F1. The primary purpose of this replacement well will be to provide a point of monitoring between the lined and unlined landfills to confirm performance of the lined cell in the future.

Please proceed with the installation of the proposed MW-F1 as outlined and do not hesitate to contact me if you have any questions at (802) 522-0561 or kasey.kathan@state.vt.us

Best,

Kasey Kathan

Shaded values exceed Vermont Groundwater Enforcement Standard, as set by Vermont Groundwater Protection Rule and Strategy (GWPRS) 2005.
Bolded values exceed Vermont Preventive Action Level (PAL) as set by GWPRS, 2005.
Underlined values exceed VT Max. Acceptable Change, GWPRS, 2005.
Italicized values exceed Vermont Health Advisory as set by GWPRS, 2005.
[1] VT GES = VT Groundwater Enforcement Standards and Preventive Action Levels from Table 2, Groundwater Protection Rule & Strategy (GWPRS), 2005.
[2] VT Maximum Acceptable Change from Table 3, GWPRS, 2005.
[3] Vermont Health Advisory Levels and Federal MCLs from December 2002 Vermont Department of Health Drinking Water Guidance.
"<" means not detected, to the reported detection limit shown.
NA = Not analyzed.
Blank cell indicates no data collected.

[1] VT GES = VT Groundwater Enforcement Standards and Preventive Action Levels from Table 1, Groundwater Protection Rule & Strategy (GWPRS), 2005.

[2] From December 2002 Vermont Department of Health Drinking Water Guidance.

* Bold values exceed Vermont Preventive Action Level

** Shaded values exceed Vermont GES, as set by Vermont GWPRS, 2005.

*** As of 2/26/2007, the Primary Vermont Groundwater Enforcement Standard for Manganese was changed from 0.840 mg/L to 0.300 mg/L.

The < values listed here are the reported detection limit.

[a] through [u3]: See last page of inorganic data for additional notes.

[3] Statistical analyses are conducted only on data since 5/15/1998, when requirement changed to TOTAL metals instead of dissolved metals, except for Mn & Fe (see note below).
Archived data has not been included in statistical analyses since 5/15/1998.

[4] For Fe and Mn only, requirement since 5/15/1998 is to analyze for both total and dissolved forms. The dissolved archived data are not included in the statistical analyses to give consistency between dissolved and total Mn & Fe as prior to 5/98, samples were not analyzed for total and dissolved metals on the same date. This gives consistency of comparisons between dissolved and total Fe and Mn.

+MW sampling utilized low-flow technology at the request of the State when sufficient water was available.

[1] VT GES = VT Groundwater Enforcement Standards and Preventive Action Levels from Table 1, Groundwater Protection Rule & Strategy (GWPRS), 2005.

[2] From December 2002 Vermont Department of Health Drinking Water Guidance.

* Bold values exceed Vermont Preventive Action Level

** Shaded values exceed Vermont GES, as set by Vermont GWPRS, 2005.

*** As of 2/26/2007, the Primary Vermont Groundwater Enforcement Standard for Manganese was changed from 0.840 mg/L to 0.300 mg/L.

The < values listed here are the reported detection limit.

[a] through [u3]: See last page of inorganic data for additional notes.

[3] Statistical analyses are conducted only on data since 5/15/1998, when requirement changed to TOTAL metals instead of dissolved metals, except for Mn & Fe (see note below).
Archived data has not been included in statistical analyses since 5/15/1998.

[4] For Fe and Mn only, requirement since 5/15/1998 is to analyze for both total and dissolved forms. The dissolved archived data are not included in the statistical analyses to give consistency between dissolved and total Mn & Fe as prior to 5/98, samples were not analyzed for total and dissolved metals on the same date. This gives consistency of comparisons between dissolved and total Fe and Mn.

+MW sampling utilized low-flow technology at the request of the State when sufficient water was available.

[1] VT GES = VT Groundwater Enforcement Standards and Preventive Action Levels from Table 1, Groundwater Protection Rule & Strategy (GWPRS), 2005.
[2] From December 2002 Vermont Department of Health Drinking Water Guidance.
* Bold values exceed Vermont Preventive Action Level
** Shaded values exceed Vermont GES, as set by Vermont GWPRS, 2005.
*** As of 2/26/2007, the Primary Vermont Groundwater Enforcement Standard for Manganese was changed from 0.840 mg/L to 0.300 mg/L.
The < values listed here are the reported detection limit.
[a] through [s]: See last page of inorganic data for footnotes of additional notes.
[3] Statistical analyses are conducted only on data since 5/15/1998, when requirement changed to TOTAL metals instead of dissolved metals, except for Mn & Fe (see note below).
Archived data has not been included in statistical analyses since 5/15/1998.
[4] For Fe and Mn only, requirement since 5/15/1998 is to analyze for both total and dissolved forms. The dissolved archived data are not included in the statistical analyses to give consistency between dissolved and total Mn & Fe as prior to 5/98, samples were not analyzed for total and dissolved metals on the same date. This gives consistency of comparisons between dissolved and total Fe and Mn.
Beginning in Feb. 2014, samples collected via low-flow technology. Indicator parameters shown are from stabilized readings.
^ grab sample, with Indicator parameters taken from grab, because low-flow samplign was not instituted until Feb. 2014.

[1] VT GES = VT Groundwater Enforcement Standards and Preventive Action Levels from Table 1, Groundwater Protection Rule & Strategy (GWPRS), 2005.

[2] From December 2002 Vermont Department of Health Drinking Water Guidance.

* Bold values exceed Vermont Preventive Action Level

** Shaded values exceed Vermont GES, as set by Vermont GWPRS, 2005.

*** As of 2/26/2007, the Primary Vermont Groundwater Enforcement Standard for Manganese was changed from 0.840 mg/L to 0.300 mg/L.

The < values listed here are the reported detection limit.

[a] through [u3]: See last page of inorganic data for additional notes.

[3] Statistical analyses are conducted only on data since 5/15/1998, when requirement changed to TOTAL metals instead of dissolved metals, except for Mn & Fe (see note below).

Archived data has not been included in statistical analyses since 5/15/1998.

[4] For Fe and Mn only, requirement since 5/15/1998 is to analyze for both total and dissolved forms. The dissolved archived data are not included in the statistical analyses to give consistency between dissolved and total Mn & Fe as prior to 5/98, samples were not analyzed for total and dissolved metals on the same date. This gives consistency of comparisons between dissolved and total Fe and Mn.

+MW sampling utilized low-flow technology at the request of the State when sufficient water was available.

[1] VT GES = VT Groundwater Enforcement Standards and Preventive Action Levels from Table 1, Groundwater Protection Rule & Strategy (GWPRS), 2005.

[2] From December 2002 Vermont Department of Health Drinking Water Guidance.

* Bold values exceed Vermont Preventive Action Level

** Shaded values exceed Vermont GES, as set by Vermont GWPRS, 2005.

*** As of 2/26/2007, the Primary Vermont Groundwater Enforcement Standard for Manganese was changed from 0.840 mg/L to 0.300 mg/L.

The < values listed here are the reported detection limit.

M- = the laboratory fortified matrix (LFM) analysis indicates a potential negative bias in the reported value

[a] through [u3]: See last page of inorganic data for additional notes.

[3] Statistical analyses are conducted only on data since 5/15/1998, when requirement changed to TOTAL metals instead of dissolved metals, except for Mn & Fe (see note below).
Archived data has not been included in statistical analyses since 5/15/1998.

[4] For Fe and Mn only, requirement since 5/15/1998 is to analyze for both total and dissolved forms. The dissolved archived data are not included in the statistical analyses to give consistency between dissolved and total Mn & Fe as prior to 5/98, samples were not analyzed for total and dissolved metals on the same date. This gives consistency of comparisons between dissolved and total Fe and Mn.

+MW sampling utilized low-flow technology at the request of the State when sufficient water was available.

[1] VT GES = VT Groundwater Enforcement Standards and Preventive Action Levels from Table 1, Groundwater Protection Rule & Strategy (GWPRS), 2005.

[2] From December 2002 Vermont Department of Health Drinking Water Guidance.

* Bold values exceed Vermont Preventive Action Level

** Shaded values exceed Vermont GES, as set by Vermont GWPRS, 2005.

*** As of 2/26/2007, the Primary Vermont Groundwater Enforcement Standard for Manganese was changed from 0.840 mg/L to 0.300 mg/L.

The < values listed here are the reported detection limit.

M- = the laboratory fortified matrix (LFM) analysis indicates a potential negative bias for the reported values of total selenium and total thllium on October 6, 2008

[a] through [u3]: See last page of inorganic data for additional notes.

[3] Statistical analyses are conducted only on data since 5/15/1998, when requirement changed to TOTAL metals instead of dissolved metals, except for Mn & Fe (see note below).
Archived data has not been included in statistical analyses since 5/15/1998.

[4] For Fe and Mn only, requirement since 5/15/1998 is to analyze for both total and dissolved forms. The dissolved archived data are not included in the statistical analyses to give consistency between dissolved and total Mn & Fe as prior to 5/98, samples were not analyzed for total and dissolved metals on the same date. This gives consistency of comparisons between dissolved and total Fe and Mn.

+MW sampling utilized low-flow technology at the request of the State when sufficient water was available.

[1] VT GES = VT Groundwater Enforcement Standards and Preventive Action Levels from Table 1, Groundwater Protection Rule & Strategy (GWPRS), 2005.

[2] From December 2002 Vermont Department of Health Drinking Water Guidance.

* Bold values exceed Vermont Preventive Action Level

** Shaded values exceed Vermont GES, as set by Vermont GWPRS, 2005.

*** As of 2/26/2007, the Primary Vermont Groundwater Enforcement Standard for Manganese was changed from 0.840 mg/L to 0.300 mg/L.

The < values listed here are the reported detection limit.

[a] through [u3]: See last page of inorganic data for additional notes.

[3] Statistical analyses are conducted only on data since 5/15/1998, when requirement changed to TOTAL metals instead of dissolved metals, except for Mn & Fe (see note below).

Archived data has not been included in statistical analyses since 5/15/1998.

[4] For Fe and Mn only, requirement since 5/15/1998 is to analyze for both total and dissolved forms. The dissolved archived data are not included in the statistical analyses to give consistency between dissolved and total Mn & Fe as prior to 5/98, samples were not analyzed for total and dissolved metals on the same date. This gives consistency of comparisons between dissolved and total Fe and Mn.

+MW sampling utilized low-flow technology at the request of the State when sufficient water was available.

[1] VT GES = VT Groundwater Enforcement Standards and Preventive Action Levels from Table 1, Groundwater Protection Rule & Strategy (GWPRS), 2005.

[2] From December 2002 Vermont Department of Health Drinking Water Guidance.

* Bold values exceed Vermont Preventive Action Level

** Shaded values exceed Vermont GES, as set by Vermont GWPRS, 2005.

*** As of 2/26/2007, the Primary Vermont Groundwater Enforcement Standard for Manganese was changed from 0.840 mg/L to 0.300 mg/L.

The < values listed here are the reported detection limit.

[a] through [u3]: See last page of inorganic data for additional notes.

[3] Statistical analyses are conducted only on data since 5/15/1998, when requirement changed to TOTAL metals instead of dissolved metals, except for Mn & Fe (see note below).
Archived data has not been included in statistical analyses since 5/15/1998.

[4] For Fe and Mn only, requirement since 5/15/1998 is to analyze for both total and dissolved forms. The dissolved archived data are not included in the statistical analyses to give consistency between dissolved and total Mn & Fe as prior to 5/98, samples were not analyzed for total and dissolved metals on the same date. This gives consistency of comparisons between dissolved and total Fe and Mn.

+MW sampling utilized low-flow technology at the request of the State when sufficient water was available.

*** As of 2/26/2007, the Primary Vermont Groundwater Enforcement Standard for Manganese was changed from 0.840 mg/L to 0.300 mg/L.

The < values listed here are the reported detection limit.

M- = The laboratory fortified matrix (LFM) analysis indicates a potential negaive bias for Total Selenium and Total Thallium on October 6, 2008

[a] through [u3]: See last page of inorganic data for additional notes.

[3] Statistical analyses are conducted only on data since 5/15/1998, when requirement changed to TOTAL metals instead of dissolved metals, except for Mn & Fe (see note below).
Archived data has not been included in statistical analyses since 5/15/1998.

[4] For Fe and Mn only, requirement since 5/15/1998 is to analyze for both total and dissolved forms. The dissolved archived data are not included in the statistical analyses to give consistency between dissolved and total Mn & Fe as prior to 5/98, samples were not analyzed for total and dissolved metals on the same date. This gives consistency of comparisons between dissolved and total Fe and Mn.

^ Insufficient water to low-flow well, grab sample obtained

[1] VT GES = VT Groundwater Enforcement Standards and Preventive Action Levels from Table 1, Groundwater Protection Rule & Strategy (GWPRS), 2005.

[2] From December 2002 Vermont Department of Health Drinking Water Guidance.

* Bold values exceed Vermont Preventive Action Level

** Shaded values exceed Vermont GES, as set by Vermont GWPRS, 2005.

*** As of 2/26/2007, the Primary Vermont Groundwater Enforcement Standard for Manganese was changed from 0.840 mg/L to 0.300 mg/L.

The < values listed here are the reported detection limit.

[a] through [u3]: See last page of inorganic data for additional notes.

[3] Statistical analyses are conducted only on data since 5/15/1998, when requirement changed to TOTAL metals instead of dissolved metals, except for Mn & Fe (see note below).

Archived data has not been included in statistical analyses since 5/15/1998.

[4] For Fe and Mn only, requirement since 5/15/1998 is to analyze for both total and dissolved forms. The dissolved archived data are not included in the statistical analyses to give consistency between dissolved and total Mn & Fe as prior to 5/98, samples were not analyzed for total and dissolved metals on the same date. This gives consistency of comparisons between dissolved and total Fe and Mn.

[1] VT GES = VT Groundwater Enforcement Standards and Preventive Action Levels from Table 1, Groundwater Protection Rule & Strategy (GWPRS), 2005.

[2] From December 2002 Vermont Department of Health Drinking Water Guidance.

* Bold values exceed Vermont Preventive Action Level

** Shaded values exceed VT GES, as set by GWPRS, 2005.

*** As of 2/26/2007, the Primary Vermont GES for Manganese was changed from 0.840 mg/L to 0.300 mg/L.

The < values listed here are the reported detection limit.

[a] through [u3]: See last page of inorganic data for additional notes.

[3] Statistical analyses are conducted only on data since 5/15/1998, when requirement changed to TOTAL metals instead of dissolved metals, except for Mn & Fe (see note below).

Archived data has not been included in statistical analyses since 5/15/1998.

[4] For Fe and Mn only, requirement since 5/15/1998 is to analyze for both total and dissolved forms. The dissolved archived data are not included in the statistical analyses to give consistency between dissolved and total Mn & Fe as prior to 5/98, samples were not analyzed for total and dissolved metals on the same date. This gives consistency of comparisons between dissolved and total Fe and Mn.

+MW sampling utilized low-flow technology at the request of the State when sufficient water was available.

[1] VT GES = VT Groundwater Enforcement Standards and Preventive Action Levels from Table 1, Groundwater Protection Rule & Strategy (GWPRS), 2005.

[2] From December 2002 Vermont Department of Health Drinking Water Guidance.

* Bold values exceed Vermont Preventive Action Level

** Shaded values exceed Vermont GES, as set by Vermont GWPRS, 2005.

*** As of 2/26/2007, the Primary Vermont GES for Manganese was changed from 0.840 mg/L to 0.300 mg/L.

The < values listed here are the reported detection limit.

[a] through [u3]: See last page of inorganic data for additional notes.

[3] Statistical analyses are conducted only on data since 5/15/1998, when requirement changed to TOTAL metals instead of dissolved metals, except for Mn & Fe (see note below).

Archived data has not been included in statistical analyses since 5/15/1998.

[4] For Fe and Mn only, requirement since 5/15/1998 is to analyze for both total and dissolved forms. The dissolved archived data are not included in the statistical analyses to give consistency between dissolved and total Mn & Fe as prior to 5/98, samples were not analyzed for total and dissolved metals on the same date. This gives consistency of comparisons between dissolved and total Fe and Mn.

+MW sampling utilized low-flow technology at the request of the State when sufficient water was available.

[1] VT GES = VT Groundwater Enforcement Standards and Preventive Action Levels from Table 1, Groundwater Protection Rule & Strategy (GWPRS), 2005.

[2] From December 2002 Vermont Department of Health Drinking Water Guidance.

* Bold values exceed Vermont Preventive Action Level

** Shaded values exceed Vermont GES, as set by Vermont GWPRS, 2005.

*** As of 2/26/2007, the Primary Vermont GES for Manganese was changed from 0.840 mg/L to 0.300 mg/L.

The < values listed here are the reported detection limit.

[a] through [u3]: See last page of inorganic data for additional notes.

[3] Statistical analyses are conducted only on data since 5/15/1998, when requirement changed to TOTAL metals instead of dissolved metals, except for Mn & Fe (see note below).

Archived data has not been included in statistical analyses since 5/15/1998.

[4] For Fe and Mn only, requirement since 5/15/1998 is to analyze for both total and dissolved forms. The dissolved archived data are not included in the statistical analyses to give consistency between dissolved and total Mn & Fe as prior to 5/98, samples were not analyzed for total and dissolved metals on the same date. This gives consistency of comparisons between dissolved and total Fe and Mn.

+MW sampling utilized low-flow technology at the request of the State when sufficient water was available.

[1] VT GES = VT Groundwater Enforcement Standards and Preventive Action Levels from Table 1, Groundwater Protection Rule & Strategy (GWPRS), 2005.

[2] From December 2002 Vermont Department of Health Drinking Water Guidance.

* Bold values exceed Vermont Preventive Action Level

** Shaded values exceed Vermont GES, as set by Vermont GWPRS, 2005.

*** As of 2/26/2007, the Primary Vermont GES for Manganese was changed from 0.840 mg/L to 0.300 mg/L.

The < values listed here are the reported detection limit.

[a] through [u3]: See last page of inorganic data for additional notes.

[3] Statistical analyses are conducted only on data since 5/15/1998, when requirement changed to TOTAL metals instead of dissolved metals, except for Mn & Fe (see note below).
Archived data has not been included in statistical analyses since 5/15/1998.

[4] For Fe and Mn only, requirement since 5/15/1998 is to analyze for both total and dissolved forms. The dissolved archived data are not included in the statistical analyses to give consistency between dissolved and total Mn & Fe as prior to 5/98, samples were not analyzed for total and dissolved metals on the same date. This gives consistency of comparisons between dissolved and total Fe and Mn.

[7] Re-sampling was conducted on 6/20/11 due to questionable results from 5/4/11

+MW sampling utilized low-flow technology at the request of the State when sufficient water was available.

[1] VT GES = VT Groundwater Enforcement Standards and Preventive Action Levels from Table 1, Groundwater Protection Rule & Strategy (GWPRS), 2005.

[2] From December 2002 Vermont Department of Health Drinking Water Guidance.

* Bold values exceed Vermont Preventive Action Level

** Shaded values exceed Vermont GES, as set by Vermont GWPRS, 2005.

*** As of 2/26/2007, the Primary Vermont Groundwater Enforcement Standard for Manganese was changed from 0.840 mg/L to 0.300 mg/L.

The < values listed here are the reported detection limit.

[a] through [u3]: See last page of inorganic data for additional notes.

[3] Statistical analyses are conducted only on data since 5/15/1998, when requirement changed to TOTAL metals instead of dissolved metals, except for Mn & Fe (see note below).
Archived data has not been included in statistical analyses since 5/15/1998.

[4] For Fe and Mn only, requirement since 5/15/1998 is to analyze for both total and dissolved forms. The dissolved archived data are not included in the statistical analyses to give consistency between dissolved and total Mn & Fe as prior to 5/98, samples were not analyzed for total and dissolved metals on the same date. This gives consistency of comparisons between dissolved and total Fe and Mn.

-Could not get pump to stabilize flow rate for proper low-flow sampling, sample taken before reading stabalized

+MW sampling utilized low-flow technology at the request of the State when sufficient water was available.

[1] VT GES = VT Groundwater Enforcement Standards and Preventive Action Levels from Table 1, Groundwater Protection Rule & Strategy (GWPRS), 2005.

[2] From December 2002 Vermont Department of Health Drinking Water Guidance.

* Bold values exceed Vermont Preventive Action Level

** Shaded values exceed Vermont GES, as set by Vermont GWPRS, 2005.

*** As of 2/26/2007, the Primary Vermont Groundwater Enforcement Standard for Manganese was changed from 0.840 mg/L to 0.300 mg/L.

The < values listed here are the reported detection limit.

[a] through [u3]: See last page of inorganic data for additional notes.

[3] Statistical analyses are conducted only on data since 5/15/1998, when requirement changed to TOTAL metals instead of dissolved metals, except for Mn & Fe (see note below).
Archived data has not been included in statistical analyses since 5/15/1998.

[4] For Fe and Mn only, requirement since 5/15/1998 is to analyze for both total and dissolved forms. The dissolved archived data are not included in the statistical analyses to give consistency between dissolved and total Mn & Fe as prior to 5/98, samples were not analyzed for total and dissolved metals on the same date. This gives consistency of comparisons between dissolved and total Fe and Mn.

+MW sampling utilized low-flow technology at the request of the State when sufficient water was available.

[1] VT GES = VT Groundwater Enforcement Standards and Preventive Action Levels from Table 1, Groundwater Protection Rule & Strategy (GWPRS), 2005.

[2] From December 2002 Vermont Department of Health Drinking Water Guidance.

* Bold values exceed Vermont Preventive Action Level

** Shaded values exceed Vermont GES, as set by Vermont GWPRS, 2005.

*** As of 2/26/2007, the Primary Vermont Groundwater Enforcement Standard for Manganese was changed from 0.840 mg/L to 0.300 mg/L.

The < values listed here are the reported detection limit.

[a] through [u3]: See last page of inorganic data for additional notes.

[3] Statistical analyses are conducted only on data since 5/15/1998, when requirement changed to TOTAL metals instead of dissolved metals, except for Mn & Fe (see note below).

Archived data has not been included in statistical analyses since 5/15/1998.

[4] For Fe and Mn only, requirement since 5/15/1998 is to analyze for both total and dissolved forms. The dissolved archived data are not included in the statistical analyses to give consistency between dissolved and total Mn & Fe as prior to 5/98, samples were not analyzed for total and dissolved metals on the same date. This gives consistency of comparisons between dissolved and total Fe and Mn.

[5] Re-sampling was conducted on 6/20/11 due to questionable results from 5/4/11

^ Insufficient water to low-flow well, grab sample obtained

/ COD sample not preserved to pH<2 qualified by lab for several ICP metal values due to inter-element interfrenece from sample matrix due to significant amount of sediment, see lab report

[1] VT GES = VT Groundwater Enforcement Standards and Preventive Action Levels from Table 1, Groundwater Protection Rule & Strategy (GWPRS), 2005.

[2] From December 2002 Vermont Department of Health Drinking Water Guidance.

* Bold values exceed Vermont Preventive Action Level

** Shaded values exceed Vermont GES, as set by Vermont GWPRS, 2005.

*** As of 2/26/2007, the Primary Vermont Groundwater Enforcement Standard for Manganese was changed from 0.840 mg/L to 0.300 mg/L.

The < values listed here are the reported detection limit.

[a] through [u3]: See last page of inorganic data for additional notes.

[3] Statistical analyses are conducted only on data since 5/15/1998, when requirement changed to TOTAL metals instead of dissolved metals, except for Mn & Fe (see note below).
Archived data has not been included in statistical analyses since 5/15/1998.

[4] For Fe and Mn only, requirement since 5/15/1998 is to analyze for both total and dissolved forms. The dissolved archived data are not included in the statistical analyses to give consistency between dissolved and total Mn & Fe as prior to 5/98, samples were not analyzed for total and dissolved metals on the same date. This gives consistency of comparisons between dissolved and total Fe and Mn.

Footnotes to Inorganic Groundwater Summary Tables

[a] Analysis also included: Total Antimony < 4ug/l, Total Beryllium < 5 ug/l, Total Cobalt < 20 ug/l, Total Selenium < 5 ug/l, Total Silver < 10 ug/l, Total Thallium < 2 ug/l, Total Vanadium < 50 ug/l
[b] Analysis also included: Total Antimony < 4ug/l, Total Beryllium < 2 ug/l, Total Cobalt < 10 ug/l, Total Selenium < 5 ug/l, Total Silver < 10 ug/l, Total Thallium < 1 ug/l, Total Vanadium < 10 ug/l
[c] Note b except Total Cobalt detected above detection limit of 10 ug/l.
[d] Analysis also included: Total Antimony < 4ug/l, Total Beryllium < 2 ug/l, Total Cobalt < 10 ug/l, Total Selenium < 5 ug/l, Total Silver < 10 ug/l, Total Thallium < 1 ug/l, Total Vanadium < 20 ug/l
[e] Note d except Total Cobalt detected above detection limit of 10 ug/l.
[f] Analysis also included: Total Antimony < 2ug/l, Total Beryllium < 2 ug/l, Total Cobalt < 10 ug/l, Total Selenium < 5 ug/l, Total Silver < 10 ug/l, Total Thallium < 1 ug/l, Total Vanadium < 20 ug/l
[g] Note f except Total Cobalt and Total Vanadium detected above detection limit of 10 ug/l.
[h] Note f except Total Cobalt detected above detection limit of 10 ug/l.
[i] Analysis also included: Total Antimony < 2ug/l, Total Beryllium < 2 ug/l, Total Cobalt < 10 ug/l, Total Selenium < 5 ug/l, Total Thallium < 1 ug/l, Total Vanadium < 20 ug/l
[j] Note i except Total Cobalt and Total Vanadium detected above detection limit of 10 ug/l.
[k] Note i except Total Vanadium detected above detection limit of 10 ug/l.
[l] Note i except total cobalt detected above detection limit of 10 ug/l.
[m] Note d except Total Cobalt, Total Vanadium and Selenium detected above detection limits.
[n] Note a except Total Barium & Chromium detected above detection limits.
[o] Note a except Total Beryllium, Cobalt and Vanadium detected above detection limits.
[p] Analysis also included: Total Barium detected above detection limit

[q] Arsenic detected above detection limit, analysis also included: Total Barium <20 ug/l, Total Cadmium <3 ug/l, total Chromium <10 ug/l, Total Copper <0.010 ug/l, Total Lead <2 ug/l, Total Nickel <20 ug/l, Total Zinc <0.020 ug/l
[r] Analysis also included: Total Barium <20 ug/l
[s] Analysis also included: Total Antimony < 2 ug/l, Total Beryllium <4 ug/l, Total Cobalt <10 ug/l, total selenium<5 ug/l, Total Thallium < 1 ug/l, Total Vanadium <20 ug/l
[t] Note s except Total Barium, Total Cobalt, and Total Vanadium detected above detection limit
[u] Analysis also included: Total Antimony < 2 ug/l, Total Beryllium <2 ug/l, Total Cobalt <10 ug/l, total selenium<5 ug/l, Total Thallium < 1 ug/l, Total Vanadium <20 ug/l
[v] Note p plus Dissolved Nickel <20 ug/l
[w] note u except Total Barium detected above detection limit
[x] analysis also included: Dissolved Arsenic <2 ug/l, Total Barium <20 ug/l, Dissolved Barium <20 ug/l, Dissolved Nickel <20 ug/l, Dissolved Zinc <0.020 ug/l
[y] not x except Dissolved Arsenic and Total Barium detected above detection limit
[z] note u except Total Barium, Total Cobalt, and Total Vanadium detected above detection limit
[aa] note x except Total Barium and Dissolved Copper detected above detection limit, plus Dissolved Chromium <10 ug/l, Dissolved Lead <2 ug/l

[bb] Analysis also included: Total Antimony <2 ug/l, total beryllium <2 ug/l, total barium <2 ug/l, total cobalt ,10 ug/l, total selenium , 10 ug/l, total selenium ,10 ug/l, total thallium ,1 ug/l, total vanadium , 20 ug/l
[cc] note bb except total cobalt and total barium detected above detection limit
[dd] note bb except total barium detected above detection limit
[ee] On 2/25/05 the arsenic GES decreased from 50 ug/L to 10 ug/L and the PAL decreased from 5 ug/L to 1 ug/L.
[ff] On 2/25/05 the lead PAL decreased from 5 ug/L to 1.5 ug/L.
[gg] On 2/25/05 the mercury PAL decreased from 1 ug/L to 0.5 ug/L.
[hh] Note n, and beryllium detected at detection limit.
[ii] Note r, and beryllium and cadmium detected at or above detection limit.
[jj] Analysis also included barium and beryllium above detection limit.
[b*] Analysis also included: Total Antimony < 4ug/l, Total Beryllium < 2 ug/l, Total Cobalt < 10 ug/l, Total Selenium < 5 ug/l, Total Silver < 10 ug/l, Total Thallium < 1 ug/l, Total Vanadium < 10 ug/l
[v2*] Analysis also included: Total Antimony < 2 ug/l, Total Beryllium < 2 ug/l, Total Cobalt <20 ug/l, Total Selenium <2 ug/l, Total Silver <20 ug/L, Total Thallium < 1 ug/l, Total Vanadium <20 ug/l
[w2*] Analysis also included: Total Antimony < 2 ug/l, Total Beryllium < 2 ug/l, Total Cobalt <20 ug/l, Total Selenium <2 ug/l, Total Silver <20 ug/L, Total Thallium < 1 ug/l, Total Vanadium <20 ug/l

*Sodium reported in indicator table

Normal Distribution?	Yes
Transformation Closest to Normal	
Does Transformation Produce Normality?	
Mean of Transformed Data	
Mean of Untransformed Data	3.97
Std. Dev. of Transformed Data	
Std. Dev. of Untransformed Data	2.21
n	20
Student's t-value (one-tailed)	1.721
Upper 95% Confidence Value	4.814
Lower 95% Confidence Value	**3.116**

[1] VT GES = VT Groundwater Enforcement Standards and Preventive Action Levels from Table 1, Groundwater Protection Rule & Strategy (GWPRS), 2005.
[2] From December 2002 Vermont Department of Health Drinking Water Guidance.
* Bold values exceed Vermont Preventive Action Level
** Shaded values exceed Vermont GES, as set by Vermont GWPRS, 2005.
En = Endyne Inc., Williston, VT St = State of Vermont, Department of Water Resources
ND = Non-detect for all parameters tested.
Results listed here as "< - - - " are shown on lab reports as "TBQ: Trace, below quantitation limit." The < values listed here are the reported detection limit.
Blank = not detected (see individual lab reports for detection levels)
In statistical calculations, values below the detection limit are not included in calculations
PLE = Present in background laboratory environment
+MW sampling utilized low-flow technology at the request of the State when sufficient water was available.

[1] VT GES = VT Groundwater Enforcement Standards and Preventive Action Levels from Table 1, Groundwater Protection Rule & Strategy (GWPRS), 2005.
[2] From December 2002 Vermont Department of Health Drinking Water Guidance.
* Bold values exceed Vermont Preventive Action Leve
** Shaded values exceed Vermont GES, as set by Vermont GWPRS, 2005.
En = Endyne Inc., Williston, VT St = State of Vermont, Department of Water Resources
ND = Non-detect for all parameters tested.
Results listed here as "< - - - " are shown on lab reports as "TBQ: Trace, below quantitation limit." The < values listed here are the reported detection limit.
Blank = not detected (see individual lab reports for detection levels)
In statistical calculations, values below the detection limit are not included in calculations
PLE = Present in background laboratory environment
+MW sampling utilized low-flow technology at the request of the State when sufficient water was available.

[1] VT GES = VT Groundwater Enforcement Standards and Preventive Action Levels from Table 1, Groundwater Protection Rule & Strategy (GWPRS), 2005.
[2] From December 2002 Vermont Department of Health Drinking Water Guidance.
* Bold values exceed Vermont Preventive Action Lev
** Shaded values exceed Vermont GES, as set by Vermont GWPRS, 2005.
En = Endyne Inc., Williston, VT St = State of Vermont, Department of Water Resources
ND = Non-detect for all parameters tested.
Blank = not detected (see individual lab reports for detection levels)
In statistical calculations, values below the detection limit are not included in calculations

[1] Vermont GES = VT Groundwater Enforcement Standards and Preventive Action Levels from Table 1, Groundwater Protectoin Rule & Strategy (GWPRS), 2005.
[2] from December 2002 Vermont Department of Health Drinking Water Guidance.
En = Endyne Inc., Williston, VT St = State of Vermont, Department of Water Resources.
ND = Non-detected for all parameters tested.
*On 10/7/2009, several wells that are typically non-detected to VOCs had small acetone detections, most likely due to sampling or lab contamination,
The wells with these detections are indicated and the concentrations are in parentheses.
+MW sampling utilized low-flow technology at the request of the State when sufficient water was available.

[1] Vermont GES = VT Groundwater Enforcement Standards and Preventive Action Levels from Table 1, Groundwater Protectoin Rule & Strategy (GWPRS), 2005.
[2] from December 2002 Vermont Department of Health Drinking Water Guidance.
En = Endyne Inc., Williston, VT St = State of Vermont, Department of Water Resources
ND = Non-detect for all parameters tested.
*On 10/7/2009, several wells that are typically non-detected to VOCs had small acetone detections, most likely due to sampling or lab contamination,
The wells with these detections are indicated and the concentrations are in parentheses.
+MW sampling utilized low-flow technology at the request of the State when sufficient water was available.

[1] Vermont GES = VT Groundwater Enforcement Standards and Preventive Action Levels from Table 1,
[2] from December 2002 Vermont Department of Health Drinking Water Guidance.
En = Endyne Inc., Williston, VT.
ND = Non-detected for all parameters tested.
NS = No Sample
+MW sampling utilized low-flow technology.

"ND" indicates no detects for that test method (see individual lab reports for detection levels).
Blank cell in table = not analyzed by that test method.
Sampling for SVOCs (EPA Method 8270) began in Oct. 2004, per amended Solid Waste Cert. (dated 5 Oct. '04).
[2] Data between 1981 and 1998 are archived to conserve table space and can be shown upon request. Statistics are not required to be run.

Leachate Sampling Summary Sheet

Project Name:	NEWSVT
Location:	Coventry, Vermont
Project Number:	93320
Date of Sampling:	2/10/2015
H&N Personnel:	Wendy Krembs & Christopher Page
Weather:	Sunny
Air Temperature:	15-20°F
Equipment	
pH Meter:	YSI 556 multi parameter probe
Temp./S. Conduct:	YSI 556 multi parameter probe

Field Measurements

Leachate Sampling Location		Phase I	Phase II	Phase III Cell I	Phase III Cell II	Phase IV Cell I	Phase IV Cell II	Phase IV Cell IIIA	Combined
		Primary	Primary	Primary	Primary	Primary	Primary	Primary	Storage Tank
	Units								
pH:	S. U.								7.82
Specific Conductance:	uS/cm								14,172
Temperature:	°C								6.17
Sample Time:									13:42
Collection Method:		See sampler comments below							Piping from tank
NEWSVT Personnel:									AJ

Sampler comments: Samples from the Combined Leachate Tank were collected from the piping leading from the AST to fill tanker trucks. The appropriate lab sampling bottles were provided by WHEM and filled by NEWSVT personnel listed above, with the 40-ml vials filled by WHEM. Samples were stored by WHEM staff overnight on ice in a dark cooler, then transported by WHEM staff on ice in a dark cooler to Endyne the day after sampling occurred, and all remained within laboratory analysis limits.

uS/Cm = micro Siemens per centimeter
° C = degrees Celsius

Laboratory Sample Delivery Information

Samples were stored by WHEM staff overnight on ice in a dark cooler, then transported by WHEM staff on ice in a dark cooler to Endyne the day after sampling occurred.

Collection Method:		See sampler comments below							Piping from tank
NEWSVT Personnel:		Shane Wiggett							Shane Wiggett

Sampler comments:

Samples from the Combined Leachate Tank were collected from the piping leading from the AST to fill tanker trucks, and handed to WHEM personnel to fill the appropriate lab sample bottles. Samples were stored on ice in a dark cooler, and transported by WHEM staff to Endyne the same day sampling occurred.

Samples from individual phases were collected inside each leachate pump control shed from the primary leachate valve with the assistance of NEWSVT personnel listed above.

WHEM was not required to sample any of the secondary leachate.

uS/Cm = micro Siemens per centimeter
° C = degrees Celsius

Laboratory Sample Delivery Information

Samples were stored on ice in a dark cooler, and transported by WHEM staff to Endyne the same day sampling occurred.

Labs: Endyne = Endyne Inc., Williston, VT.
[a] Depletion on most concentrated sample was less than 2.0 mg/l.
[b] Residual concentration on least concentrated dilution was less than 1.0 mg/L; > = greater than listed value.
Results listed here as "<---" are shown on the lab reports as no detect. The < values listed here are the reported detection limit.
Blank = not analyzed.
* Sample was analyzed past the EPA Method specified hold time.
**Primary and Secondary sampled together.
[2] Beginning on 2/9/05, samples were analyzed for specific conductance, (temperature adjusted). Samples taken prior to this date were analyzed for conductivity.
[1] Toxicity Characteristic = Taken from Vermont Hazardous Waste Management Regulations March 15, 2013. Chapter 2, Table 1, Maximum Concentration of Contaminants for the Characteristic of Toxicity.
Italicized data indicates that the data was qualified by the laboratory for QA/QC purposes. See laboratory reports for individual qualifiers, which are defined at the end of each laboratory report.

Labs: Endyne = Endyne Inc., Williston, VT.
[b] Residual concentration on least concentrated dilution was less than 1.0 mg/L; > = greater than listed value.
[c] Sample was re-analyzed past EPA method specified holding time.
Results listed here as "<---" means not detected to the reported detection limit.
Blank = not analyzed
**Primary and Secondary sampled together.
*Laboratory fortified matrix analysis indicates there may be a positive interference.
[2] Beginning on 2/9/05, samples were analyzed for specific conductance, (temperature adjusted). Samples taken prior to this date were analyzed for conductivity.

Labs: Endyne = Endyne Inc., Williston, VT.
**Primary and Secondary sampled together.
Results listed here as "<---" means not detected to the reported detection limit.
[1] Toxicity Characteristic = Taken from Vermont Hazardous Waste Management Regulations March 15, 2013. Chapter 2, Table 1, Maximum Concentration of Contaminants for the Characteristic of Toxicity.
Italicized data indicates that the data was qualified by the laboratory for QA/QC purposes. See laboratory reports for individual qualifiers, which are defined at the end of each laboratory report.

Labs: Endyne = Endyne Inc., Williston, VT.
Results listed here as "<---" are shown on the lab reports as no detect. The < values listed here are the reported detection limit.
[a] Depletion on most concentrated sample was less than 2.0 mg/l.
Blank = not analyzed.
**Primary and Secondary sampled together.
* BOD was reanalyzed past the EPA specified hold time.
[2] Beginning on 2/9/05, samples were analyzed for specific conductance, (temperature adjusted). Samples taken prior to this date were analyzed for conductivity.
[1] Toxicity Characteristic = Taken from Vermont Hazardous Waste Management Regulations March 15, 2013. Chapter 2, Table 1, Maximum Concentration of Contaminants for the Characteristic of Toxicity.
Italicized data indicates that the data was qualified by the laboratory for QA/QC purposes. See laboratory reports for individual qualifiers, which are defined at the end of each laboratory report.

Sample collected from leachate above-ground storage tank.
Labs: Endyne = Endyne Inc., Williston, VT.
Results listed here as "<---" means not detected to the reported detection limit.
Blank = not analyzed.
* 8/7/2006 was the first sampling round, taken for background analysis.
[1] Toxicity Characteristic = Taken from Vermont Hazardous Waste Management Regulations March 15, 2013. Chapter 2, Table 1, Maximum Concentration of Contaminants for the Characteristic of Toxicity.
Italicized data indicates that the data was qualified by the laboratory for QA/QC purposes. See laboratory reports for individual qualifiers, which are defined at the end of each laboratory report.

Sample collected from leachate above-ground storage tank.
Labs: Endyne = Endyne Inc., Williston, VT.
Results listed here as "<---" means not detected to the reported detection limit.
Blank = not analyzed.
* 8/7/2006 was the first sampling round, taken for background analysis.
[1] Toxicity Characteristic = Taken from Vermont Hazardous Waste Management Regulations March 15, 2013. Chapter 2, Table 1, Maximum Concentration of Contaminants for the Characteristic of Toxicity.
Italicized data indicates that the data was qualified by the laboratory for QA/QC purposes. See laboratory reports for individual qualifiers, which are defined at the end of each laboratory report.

[1] Method 8260 began on 10/12/94.
[2] EPA Method 8260B began on August 5, 1999.
Labs: Endyne = Endyne, Inc. Williston, VT.
"Method" = EPA method of analysis; "ND" indicates no detects for that test method.
NA = Method not analyzed on this date.
PLE = Present in background laboratory environment
[a] = High Sulfur contamination.
Results listed here as "<___" are shown on lab reports as "TBQ: Trace below quantitation limit." The < values listed here are the reported detection limit.
Blank = not detected (see individual lab reports for detection levels.)
*Primary and Secondary Leachate were sampled together.
[4] Toxicity Characteristic = Taken from Vermont Hazardous Waste Management Regulations March 15, 2013. Chapter 2, Table 1-Maximum Concentration of Contaminants for the Characteristic of Toxicity.
Italicized data indicates that the data was qualified by the laboratory for QA/QC purposes. See laboratory reports for individual qualifiers, which are defined at the end of each laboratory report.

[1] Method 8260 began on 10/12/94.
[2] EPA Method 8260B began on August 5, 1999.
Labs: Endyne = Endyne, Inc., Williston, VT.
"Method" = EPA method of analysis; "ND" indicates no detects for that test method.
NA = Method not analyzed on this date.
PLE = Present in background laboratory environment.
[a] = High Sulfur contamination.
Results listed here as "<___" are shown on lab reports as "TBQ: Trace below quantitation limit." The < values listed here are the reported detection limit.
Blank = not detected (see individual lab reports for detection levels).
*Primary and Secondary Leachate were sampled together.
[4] Toxicity Characteristic = Taken from Vermont Hazardous Waste Management Regulations March 15, 2013. Chapter 2, Table 1-Maximum Concentration of Contaminants for the Characteristic of Toxicity.
Italicized data indicates that the data was qualified by the laboratory for QA/QC purposes. See laboratory reports for individual qualifiers, which are defined at the end of each laboratory report.

[1] EPA Method 8260B began on August 5, 1999.
[3] Beginning with May 2001 sampling round, the VOC analyses are for the 8260 list of analytes, plus carbon disulfide (per request from NEWSVT).
Labs: Endyne = Endyne, Inc., Williston, VT.
"Method" = EPA method of analysis; "ND" indicates no detects for that test method.
NA = Method not analyzed on this date.
PLE = Present in background laboratory environment.
[a] = High Sulfur contamination.
Results listed here as "<___" are shown on lab reports as "TBQ: Trace below quantitation limit." The < values listed here are the reported detection limit.
Blank = not detected (see individual lab reports for detection levels)l
*Primary and Secondary Leachate were sampled together.
***Phase II samples were not preserved at a ph<2.
[4] Toxicity Characteristic = Taken from Vermont Hazardous Waste Management Regulations March 15, 2013. Chapter 2, Table 1-Maximum Concentration of Contaminants for the Characteristic of Toxicity.
Italicized data indicates that the data was qualified by the laboratory for QA/QC purposes. See laboratory reports for individual qualifiers, which are defined at the end of each laboratory report.

[1] EPA Method 8260B began on August 5, 1999
[3] Beginning with May 2001 sampling round, the VOC analyses are for the 8260 list of analytes, plus carbon disulfide (per request from NEWSVT).
Labs: Endyne = Endyne, Inc., Williston, VT
"Method" = EPA method of analysis; "ND" indicates no detects for that test method.
NA = Method not analyzed on this date
PLE = Present in background laboratory environment
[a] = High Sulfur contamination
Results listed here as "<___" are shown on lab reports as "TBQ: Trace below quantitation limit." The < values listed here are the reported detection limit.
blank = not detected (see individual lab reports for detection levels)
*Primary and Secondary Leachate were sampled together.
[4] Toxicity Characteristic = Taken from Vermont Hazardous Waste Management Regulations March 15, 2013. Chapter 2, Table 1-Maximum Concentration of Contaminants for the Characteristic of Toxicity.
Italicized data indicates that the data was qualified by the laboratory for QA/QC purposes. See laboratory reports for individual qualifiers, which are defined at the end of each laboratory report.

[1] EPA Method 8260B began on August 5, 1999
[3] Beginning with May 2001 sampling round, the VOC analyses are for the 8260 list of analytes, plus carbon disulfide (per request from NEWSVT).
Labs: Endyne = Endyne, Inc., Williston, VT
"Method" = EPA method of analysis; "ND" indicates no detects for that test method.
NA = Method not analyzed on this date
PLE = Present in background laboratory environment
[a] = High Sulfur contamination
Results listed here as "<___" are shown on lab reports as "TBQ: Trace below quantitation limit." The < values listed here are the reported detection limit.
blank = not detected (see individual lab reports for detection levels)
*Primary and Secondary Leachate were sampled together.
[4] Toxicity Characteristic = Taken from Vermont Hazardous Waste Management Regulations March 15, 2013. Chapter 2, Table 1-Maximum Concentration of Contaminants for the Characteristic of Toxicity.
Italicized data indicates that the data was qualified by the laboratory for QA/QC purposes. See laboratory reports for individual qualifiers, which are defined at the end of each laboratory report.

SW-3	812
SW-4	685
SW-5	848
SW-6	780
SW-7	748
SW-8	685

Notes:

1. Negative value in "Depth BGS" means water level was above ground surface by the amount shown.
2. MW-BRW-1 and MW-BRW-2R are measured only in Feb. of each year, so their GW elevs. are not used for the May 2015 GW contour map.
3. MW-BRW-3D and MW-801-BR-R are not used for the GW contour map because they are screened far below the water table, so their GW elevs. might not represent the surficial water table.

DW = Drinking water well, with well ID or Tag number shown.
NM = Depth to water level is not measured in this well.

Laboratory Report

WaiteHeindel Environmental Mgt 070338
7 Kilburn Street
Suite 301
Burlington, VT 05406
Atten: Miles Waite

PROJECT: NEWSVT LF Ground Water
WORK ORDER: **1505-08233**
DATE RECEIVED: May 06, 2015
DATE REPORTED: May 31, 2015
SAMPLER: Wendy/Miles

Enclosed please find the results of the analyses performed for the samples referenced on the attached chain of custody. All required method quality control elements including instrument calibration were performed in accordance with method requirements and determined to be acceptable unless otherwise noted.

The column labeled Lab/Tech in the accompanying report denotes the laboratory facility where the testing was performed and the technician who conducted the assay. A "W" designates the Williston, VT lab under NELAC certification ELAP 11263; "R" designates the Lebanon, NH facility under certification NH 2037 and "N" the Plattsburgh, NY lab under certification ELAP 11892. "Sub" indicates the testing was performed by a subcontracted laboratory. The accreditation status of the subcontracted lab is referenced in the corresponding NELAC and Qual fields.

The NELAC column also denotes the accreditation status of each laboratory for each reported parameter. "A" indicates the referenced laboratory is NELAC accredited for the parameter reported. "N" indicates the laboratory is not accredited. "U" indicates that NELAC does not offer accreditation for that parameter in that specific matrix. Test results denoted with an "A" meet all National Environmental Laboratory Accreditation Program requirements except where denoted by pertinent data qualifiers. Test results are representative of the samples as they were received at the laboratory

Endyne, Inc. warrants, to the best of its knowledge and belief, the accuracy of the analytical test results contained in this report, but makes no other warranty, expressed or implied, especially no warranties of merchantability or fitness for a particular purpose.

CLIENT: WaiteHeindel Environmental Mgt
PROJECT: NEWSVT LF Ground Water
REPORT DATE: 5/31/2015

WORK ORDER: **1505-08233**
DATE RECEIVED: 05/06/2015

Report Summary of Qualifiers and Notes

RPD: The Relative Percent Difference of the Matrix Spike Duplicate was above method acceptance limits.

LRB+: The digested Laboratory Reagent Blank result for this element was greater than the reporting limit, indicating that the sample result may be biased high.

B: Blank contamination was observed at levels that could affect analytical results.

M-: The Laboratory Fortified Matrix (LFM) analysis had a recovery lower than defined acceptance limits. This indicates a potential negative bias in the reported value or a difficult sample matrix that resulted in poor reproducibility between sample aliquots selected for analysis.

QA-: QA/QC associated with this analysis did not meet laboratory acceptance limits indicating the results may be biased low.

AN1: Increased reporting limit due to contaminant present in the laboratory environment.

Method 8260C: Sample 004: The sample was not preserved to a pH < 2.

Laboratory Report

WaiteHeindel Environmental Mgt 070338
7 Kilburn Street
Suite 301
Burlington, VT 05406
Atten: Miles Waite

PROJECT: NEWSVT LF Surface Water REV
WORK ORDER: **1505-08230**
DATE RECEIVED: May 06, 2015
DATE REPORTED: May 31, 2015
SAMPLER: Wendy/ Miles

Enclosed please find the results of the analyses performed for the samples referenced on the attached chain of custody. All required method quality control elements including instrument calibration were performed in accordance with method requirements and determined to be acceptable unless otherwise noted.

The column labeled Lab/Tech in the accompanying report denotes the laboratory facility where the testing was performed and the technician who conducted the assay. A "W" designates the Williston, VT lab under NELAC certification ELAP 11263; "R" designates the Lebanon, NH facility under certification NH 2037 and "N" the Plattsburgh, NY lab under certification ELAP 11892. "Sub" indicates the testing was performed by a subcontracted laboratory. The accreditation status of the subcontracted lab is referenced in the corresponding NELAC and Qual fields.

The NELAC column also denotes the accreditation status of each laboratory for each reported parameter. "A" indicates the referenced laboratory is NELAC accredited for the parameter reported. "N" indicates the laboratory is not accredited. "U" indicates that NELAC does not offer accreditation for that parameter in that specific matrix. Test results denoted with an "A" meet all National Environmental Laboratory Accreditation Program requirements except where denoted by pertinent data qualifiers. Test results are representative of the samples as they were received at the laboratory

Endyne, Inc. warrants, to the best of its knowledge and belief, the accuracy of the analytical test results contained in this report, but makes no other warranty, expressed or implied, especially no warranties of merchantability or fitness for a particular purpose.

Report Summary of Qualifiers and Notes

QA-: QA/QC associated with this analysis did not meet laboratory acceptance limits indicating the results may be biased low.

LFB-: The digested Laboratory Fortified Blank recovery for this element was less than the 85% acceptance criteria indicating that the sample result may be biased low.

LFB+: The digested Laboratory Fortified Blank recovery for this element was greater than the 115% acceptance criteria, indicating that the sample result may be biased high.

REV: Report revised 5/31/15 to correct a dilution error calculation for chloride on sample -002.

Laboratory Report

WaiteHeindel Environmental Mgt 070338
7 Kilburn Street
Suite 301
Burlington, VT 05406
Atten: Miles Waite

PROJECT: NEWSVT LF UnderDrains
WORK ORDER: **1505-08231**
DATE RECEIVED: May 06, 2015
DATE REPORTED: May 22, 2015
SAMPLER: Wendy/ Miles

Enclosed please find the results of the analyses performed for the samples referenced on the attached chain of custody. All required method quality control elements including instrument calibration were performed in accordance with method requirements and determined to be acceptable unless otherwise noted.

The column labeled Lab/Tech in the accompanying report denotes the laboratory facility where the testing was performed and the technician who conducted the assay. A "W" designates the Williston, VT lab under NELAC certification ELAP 11263; "R" designates the Lebanon, NH facility under certification NH 2037 and "N" the Plattsburgh, NY lab under certification ELAP 11892. "Sub" indicates the testing was performed by a subcontracted laboratory. The accreditation status of the subcontracted lab is referenced in the corresponding NELAC and Qual fields.

The NELAC column also denotes the accreditation status of each laboratory for each reported parameter. "A" indicates the referenced laboratory is NELAC accredited for the parameter reported. "N" indicates the laboratory is not accredited. "U" indicates that NELAC does not offer accreditation for that parameter in that specific matrix. Test results denoted with an "A" meet all National Environmental Laboratory Accreditation Program requirements except where denoted by pertinent data qualifiers. Test results are representative of the samples as they were received at the laboratory

Endyne, Inc. warrants, to the best of its knowledge and belief, the accuracy of the analytical test results contained in this report, but makes no other warranty, expressed or implied, especially no warranties of merchantability or fitness for a particular purpose.

Report Summary of Qualifiers and Notes

QA-: QA/QC associated with this analysis did not meet laboratory acceptance limits indicating the results may be biased low.

LFB-: The digested Laboratory Fortified Blank recovery for this element was less than the 85% acceptance criteria indicating that the sample result may be biased low.

LFB+: The digested Laboratory Fortified Blank recovery for this element was greater than the 115% acceptance criteria, indicating that the sample result may be biased high.

B: Blank contamination was observed at levels that could affect analytical results.

Laboratory Report

Casella Waste Management, Inc. 070338
220 Avenue B
Williston, VT 05495

Atten: Joe Gay

PROJECT: NEWSVT LF May-Oct Leachate
WORK ORDER: **1505-08232**
DATE RECEIVED: May 06, 2015
DATE REPORTED: May 28, 2015
SAMPLER: Wendy/Miles

Enclosed please find the results of the analyses performed for the samples referenced on the attached chain of custody. All required method quality control elements including instrument calibration were performed in accordance with method requirements and determined to be acceptable unless otherwise noted.

The column labeled Lab/Tech in the accompanying report denotes the laboratory facility where the testing was performed and the technician who conducted the assay. A "W" designates the Williston, VT lab under NELAC certification ELAP 11263; "R" designates the Lebanon, NH facility under certification NH 2037 and "N" the Plattsburgh, NY lab under certification ELAP 11892. "Sub" indicates the testing was performed by a subcontracted laboratory. The accreditation status of the subcontracted lab is referenced in the corresponding NELAC and Qual fields.

The NELAC column also denotes the accreditation status of each laboratory for each reported parameter. "A" indicates the referenced laboratory is NELAC accredited for the parameter reported. "N" indicates the laboratory is not accredited. "U" indicates that NELAC does not offer accreditation for that parameter in that specific matrix. Test results denoted with an "A" meet all National Environmental Laboratory Accreditation Program requirements except where denoted by pertinent data qualifiers. Test results are representative of the samples as they were received at the laboratory

Endyne, Inc. warrants, to the best of its knowledge and belief, the accuracy of the analytical test results contained in this report, but makes no other warranty, expressed or implied, especially no warranties of merchantability or fitness for a particular purpose.

Report Summary of Qualifiers and Notes

J: BOD value based on an Oxygen depletion of < 2.0 mg/L. Reported value has a higher degree of uncertainty.

QS-: Sample surrogate recovery was below laboratory control limits.

QA-: QA/QC associated with this analysis did not meet laboratory acceptance limits indicating the results may be biased low.

Vanadium, Total			
Zinc, Total			
VOC w/ Oxygenates, Water		2 - 40ml vials	<6C, ~~HCl~~ non pres VIALS Soy HCl

Phase IV Cell 1 Sampled Date/Time: 5/6/15 @ 1015 Sampler: CP

SVOC BNAs	1 - 8 oz --	Amber Glass	<6C, pH 5-9
BOD-5day	1 - 8 oz --	Plastic	<6C
Chloride			
TKN	1 - 4 oz --	Plastic	<6C, NY Phos, H2SO4
COD	to be taken from TKN bottle	Plastic or Glass	<6C, H2SO4
Metals Furnace Digestion		1 - 8 oz Plastic Total Metals	HNO3
Antimony, Total			
Arsenic, Total			
Barium, Total			
Beryllium, Total			
Cadmium, Total			
Chromium, Total			
Cobalt, Total			
Copper, Total			
Iron, Total			
Lead, Total			
Manganese, Total			
Mercury, Total			
Molybdenum, Total			
Nickel, Total			
Selenium, Total			
Silver, Total			
Sodium, Total			
Thallium, Total			
Vanadium, Total			
Zinc, Total			
VOC w/ Oxygenates, Water		2 - 40ml vials	<6C, ~~HCl~~ non pres. VIALS Soy HCl

Phase IV Cell 2 Sampled Date/Time: 5/6/15 @ 1040 Sampler: CP

SVOC BNAs	1 - 8 oz --	Amber Glass	<6C, pH 5-9
BOD-5day	1 - 8 oz --	Plastic	<6C
Chloride			
TKN	1 - 4 oz --	Plastic	<6C, NY Phos, H2SO4
COD	to be taken from TKN bottle	Plastic or Glass	<6C, H2SO4
Metals Furnace Digestion		1 - 8 oz Plastic Total Metals	HNO3
Antimony, Total			
Arsenic, Total			
Barium, Total			
Beryllium, Total			
Cadmium, Total			
Chromium, Total			
Cobalt, Total			
Copper, Total			
Iron, Total			
Lead, Total			
Manganese, Total			
Mercury, Total			
Molybdenum, Total			
Nickel, Total			
Selenium, Total			
Silver, Total			
Sodium, Total			
Thallium, Total			
Vanadium, Total			
Zinc, Total			
VOC w/ Oxygenates, Water		2 - 40ml vials	<6C, ~~HCl~~ non pres VIALS say HCl

Phase IV Cell 3 Sampled Date/Time: 5/6/15 @ 1117 Sampler: CP

SVOC BNAs	1 - 8 oz --	Amber Glass	<6C, pH 5-9
BOD-5day	1 - 8 oz --	Plastic	<6C
Chloride			
TKN	1 - 4 oz --	Plastic	<6C, NY Phos, H2SO4
COD	to be taken from TKN bottle	Plastic or Glass	<6C, H2SO4
Metals Furnace Digestion		1 - 8 oz Plastic Total Metals	HNO3
Antimony, Total			
Arsenic, Total			
Barium, Total			
Beryllium, Total			
Cadmium, Total			
Chromium, Total			
Cobalt, Total			
Copper, Total			
Iron, Total			
Lead, Total			
Manganese, Total			
Mercury, Total			
Molybdenum, Total			
Nickel, Total			
Selenium, Total			
Silver, Total			
Sodium, Total			
Thallium, Total			
Vanadium, Total			
Zinc, Total			
VOC w/ Oxygenates, Water		2 - 40ml vials	<6C, ~~HCl~~ non pres VIALS say HCl

Combined AST Sampled Date/Time: 5/6/15 @ 1140 Sampler: CP

SVOC BNAs	1 - 8 oz --	Amber Glass	<6C, pH 5-9
BOD-5day Chloride	1 - 8 oz --	Plastic	<6C
TKN	1 - 4 oz --	Plastic	<6C, NY Phos, H2SO4
COD	to be taken from TKN bottle	Plastic or Glass	<6C, H2SO4
Metals Furnace Digestion Antimony, Total Arsenic, Total Barium, Total Beryllium, Total Cadmium, Total Chromium, Total Cobalt, Total Copper, Total Iron, Total Lead, Total Manganese, Total Mercury, Total Molybdenum, Total Nickel, Total Selenium, Total Silver, Total Sodium, Total Thallium, Total Vanadium, Total Zinc, Total		1 - 8 oz Plastic Total Metals	HNO3
VOC w/ Oxygenates, Water		2 - 40ml vials	<6C, ~~HCl~~ non pres vials say HCl

Trip Blank Sampled Date/Time: 4/29/15 @ 1530 Sampler: Endyne

VOC w/ Oxygenates, Water		2 - 40ml vials	<6C, ~~HCl~~ non pres (WR)

All Vials are unpreserved and will be anlalyzed within 7 days

Relinquished by: Chris Page 5/6/15 @ 1415 Date Time
Accepted by: Wendy [illegible] 5/6/15 1634 Date Time
