Acknowledgements

The work of this Project was greatly implemented by the cooperation and assistance of many groups and individuals. The following were particularly helpful in carrying out the Project's objectives.

1. Various departments and individuals of the Vermont State Department of Highways, notably the Planning and Mapping Division and the Highway Testing Laboratory.
2. Professor D. P. Stewart of Miami University, Oxford, Ohio.
3. Professor C. G. Doll, Vermont State Geologist, University of Vermont, Burlington, Vermont.
4. United States Department of Commerce, Bureau of Public Roads.

History

The Materials Survey Project was formed in 1957 by the Vermont State Department of Highways with the assistance of the United States Bureau of Public Roads. Its prime objective was to compile an inventory of highway construction materials in the State of Vermont. Prior to the efforts of the personnel of the Survey as described in this and other reports, searches for highway construction materials were conducted only as the immediate situation required. Thus only limited areas are surveyed, and no overall picture of material resources was available. Highway contractors or resident engineers are usually required to locate the materials for their respective projects and have samples tested by the Highway Testing Laboratory. The additional cost of exploration for construction materials is passed onto the State in the form of higher construction costs. The Materials Survey Project was established to minimize or eliminate this factor by enabling the State and its contractors to proceed with information

on materials sources available beforehand. Prior knowledge of locations of suitable material is an important factor in planning future highways.

The sources of construction materials are located by this Project through ground reconnaissance study of maps and aerial photographs, and geological and physiographic interpretation. Maps, data sheets, and work sheets for reporting the findings of the Project were designed with their intended use in mind. These maps and data sheets were devised to furnish information of particular use to the contractor or construction man. For maximum benefit, the maps, data sheets, and this report should be studied simultaneously.

Inclosures

Included in this folder are two surface-geology maps, one defining the location of tests conducted on bedrock sources, the other defining the location of tests conducted on granular materials. These maps are derived from 15-minute or $7\frac{1}{2}$ -minute quadrangles of the United States Geological Survey enlarged or reduced to 1:31250 or 1" = 2604'. Delineated on the Bedrock map are the various rock types of the area. This information was obtained from numerous sources: Vermont Geological Survey Bulletins, Vermont State Geologist Reports, United States Geological Survey Bedrock Maps, and the Centennial Geological Map of Vermont, as well as other references.

The granular materials map depicts areas covered by various types of glacial deposits (outwash, moraines, kames, kame terraces, eskers, etc.) by which potential sources of gravel and sand may be recognized. This information was obtained primarily from a survey conducted by Professor D. P. Stewart of Miami University, Oxford, Ohio, who had been mapping the glacial features of Vermont during the summer months since 1956. Further

information was obtained from the Soil Survey (Reconnaissance) of Vermont conducted by the Bureau of Chemistry and Soils of the United States Department of Agriculture, and from Vermont Geological Survey Bulletins, United States Geological Survey Quadrangles, aerial photographs, the Surficial Geologic Map of Vermont, and other sources. On both maps the areas tested are represented by Identification Numbers. Several tests are usually conducted in each area represented by an Identification Number, the number of such tests being more or less arbitrarily determined either by the character of the material or by the topography.

Also included in this folder are data sheets for both the Bedrock and Granular Materials Survey, which contain detailed information for each test conducted by the Project as well as information obtained from other sources, and including an active card file compiled by the Highway Testing Laboratory. The latter information was gathered over a period of years by many persons and consequently lacks the organized approach and detail required for effective use. The information on the cards varied widely in completeness. Transfer of information from the cards to the data sheets was made without elaboration or verification. When possible, the locations of the deposits listed in the card files have also been plotted on the maps; however, some cards in the file were not used because the information on the location of the deposit was incomplete or unidentifiable. Caution should be exercised wherever this information appears incomplete. This Project does not assume responsibility for the information taken from the card files.

Work sheets contain more detailed information on each test and a detailed sketch of each identification Number Area. The work sheets and laboratory reports are on file in the office headquarters of this Project.

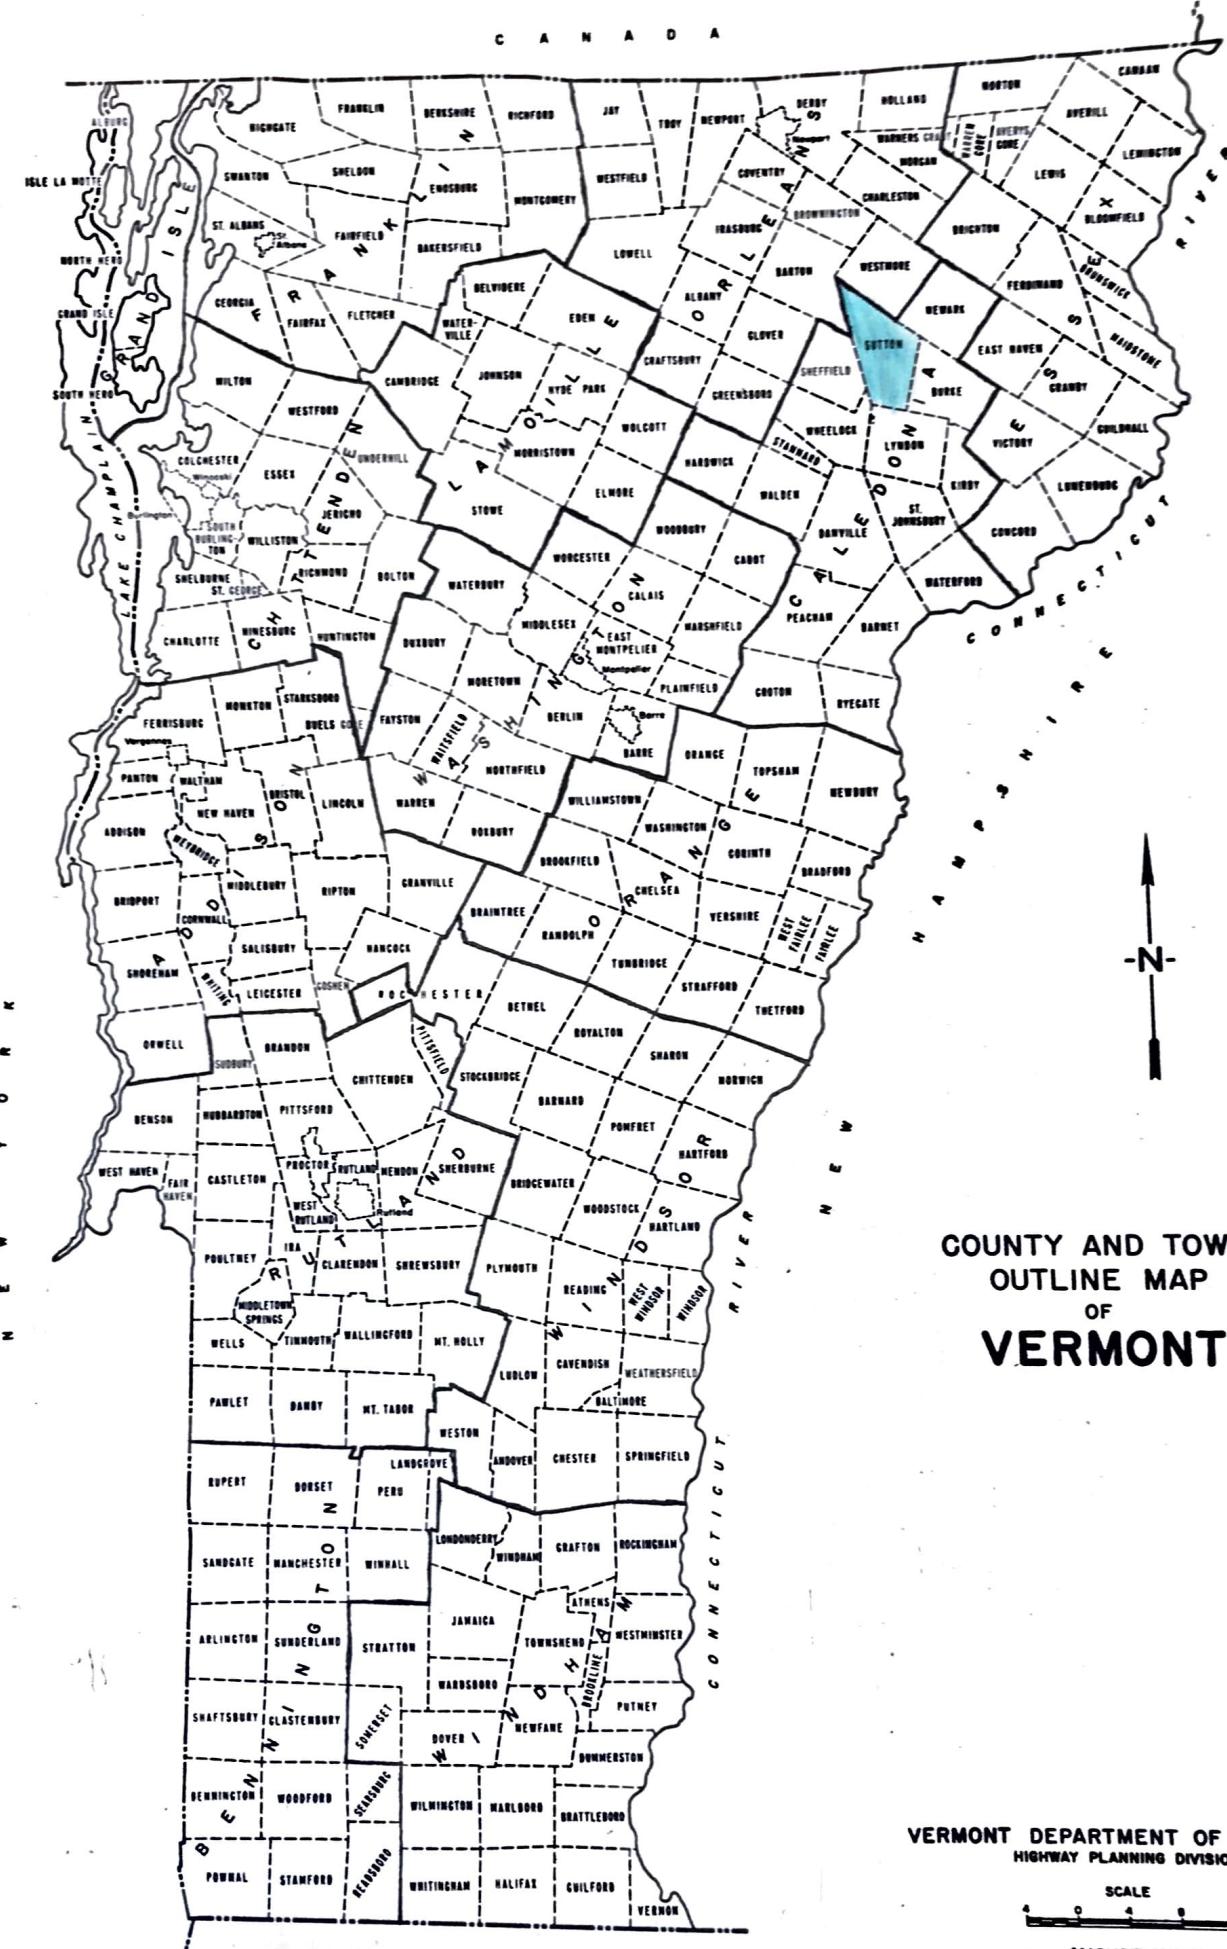

LOCATION

The town of Sutton is situated in the north northwest corner of Caledonia County, and lies in the Burke and Lyndonville Quadrangles. It is bounded by the town of Barton to the northwest, Sheffield to the west, Wheelock to the southwest, Lyndon to the south, Burke to the east, Newark to the northeast, and Westmore to the north. (See County and Town Map of Vermont on the following page.)

Sutton lies entirely within the Vermont Piedmont Physiographic Region. The town is rather hilly except in the northwest corner where Mt. Hor and Wheeler Mountain rise abruptly 500'-700' above the lower hills. Many of the lower hills are rolling and forested, and are separated by nearly flat valleys. Mt. Hor, 2, 648' is the highest elevation in town.

The divide between the St. Lawrence drainage basin to the north, and the Connecticut River drainage basin to the south, is at Summit. Air photographs show some stream valleys following fractures in the bedrock. Many ponds are chiefly the result of poor drainage impeded by glacial deposits.

Major drainage is south via Clark Brook and the West Branch of the Passumpsic River; southeast via Sutton River and Calendar Brook; and east via Bundy Brook. Calendar Brook at the Burke town line is the lowest point in Sutton at an elevation of 830'.

SURVEY OF ROCK SOURCES

Procedure for Rock Survey

The routine employed by the project in a survey of possible sources of rock for highway construction is divided into two main stages; office and field investigations.

The office investigation is conducted primarily during the winter months and comprises the mapping and description of rock types as indicated in various reference sources. Many different sources of information are utilized, as indicated in the bibliography. These references differ considerably in dependability due to new developments and studies that have contributed to the obsolescence of a number of reports. In addition, the results of samples taken by other individuals are analyzed, and the location at which these samples were taken is mapped when possible. In other words, as complete a correlation as possible is made of all the information available concerning the geology of the area under consideration.

The field investigation is begun by making a cursory preliminary survey of the entire area. The information obtained in the preliminary survey, together with the information assimilated in the office investigation, is employed to determine the areas where testing and sampling will be concentrated. When a promising source has been determined by rock type, volume of material, accessibility, and adequate exposure and relief, chip samples are taken with a hammer across the strike or trend of the rock. The samples are submitted to the Material Testing Laboratory for abrasion testing both by the Deval Method (AASHO T-3) and the Los Angeles Method (AASHO T-96). It should be kept in mind that the samples taken by the chip method are often within the weathered zone of the outcrop and consequently may give a less satisfactory test result than fresh material deeper in the rock structure. When the material is uniform and acceptable abrasion test results from the chip samples, the material source is included in this report as being satisfactory.

Discussion of Rock and Rock Sources

It should be noted that information on the Rock Materials Map is somewhat simplified. (For a more detailed description of the respective rock formations see the Summary included in this report.)

Occasionally rocks belonging to the same formation and exhibiting similar characteristics (i.e. color, texture etc.) may produce different abrasion results due to different physical and chemical properties. Therefore, in no case should satisfactory test result of an area be construed to mean that the same formation even in the same area, will not later produce unsatisfactory material. This is especially true of metamorphic rocks.

Most of Sutton is underlain by rocks of the Eastern Vermont Stratigraphic Sequence according to the Centennial Geologic Map. The remainder is underlain by the younger rocks of the New Hampshire Plutonic Series.

The Waits River schist and limestone is the oldest formation in Sutton and underlies the eastern two-thirds of the town. There are scattered road-cuts in the Waits River formation about 0.5 mile from the northwest end of State Aid Highway No. 1, but the rock is too thin-bedded for use as crushed rock. The Gile Mountain schist and quartzite, slightly younger than the Waits River formation, is exposed on the steep, upper northeast slope of Norris Mountain. It was not sampled due to its inaccessibility. In general, rock other than the granitic bodies in the northwest corner of Sutton is concealed by either glacial till or dense vegetation.

The only source of rock suitable for Item 704.06, Crushed Stone for Sub-base was sampled at Map Identification No. 1, and is the undifferentiated granitic rock of the New Hampshire Plutonic Series. The sample was taken from huge blocks below the talus slope at the south southeast base of Wheeler Mountain. Access is via the Blue Trail which leads northwest from Town Highway No. 15. The rock is a white, gray, or brown, fine- to coarse-grained granitic rock.

Some quartz veins were noted. The rock breaks sub-blocky to sub-angular.

When contacted in the summer of 1970, the owner said that he expected to sell his property very soon.

SURVEY OF SAND AND GRAVEL SOURCES

Procedure for Sand and Gravel Survey

The method employed by the project in a survey of possible sources of sand and gravel for highway construction is divided into two main stages; office and field investigations.

The office investigation is conducted primarily during the winter months and comprises the mapping of possible potentially productive areas as indicated from various references. Of these references, the survey of glacial deposits mapped by Professor Stewart proves to be valuable, particularly when used in conjunction with other references such as soil-type maps, aerial photographs, and United States Geological Survey quadrangles. The last two are used in the recognition and location of physiographic features indicating glacial deposits and in the study of drainage patterns. In addition, the locations of existing pits are mapped when known. The locations in which samples were taken by other individuals are noted and mapped when possible.

The field investigation is begun by making a cursory preliminary survey of the entire town. All pits and other areas which show physiographic features that give evidence of glacial or fluvial deposition are noted. These locations are later investigated by obtaining samples of pit faces and other exposed materials. Test pits, dug with a backhoe to a depth of approximately 11 feet, are also sampled. The samples are submitted to the Materials Testing Laboratory where they are tested for gradation and stone abrasion, the latter by the Deval Method (AASHO T-4).

108

Discussion of Sand and Gravel Deposits

The granular deposits in Sutton occur either as sands and gravels of ice-contact origin deposited as kame terraces, kame moraines, and kames; or material deposited in quiescent waters of post-glacial lakes. Some material may have been deposited as post-glacial fluvial gravel.

Several areas that were mapped by D. P. Stewart as being kame moraine or kame terrace in origin were sampled and noted to be shallow ablation till with bedrock control, or fluvial gravel. An unmapped area of good, clean pebbly sand was found at Map Identification No. 10 and is thought to be a lake sand deposited in the dammed, post-glacial overflow of Crystal Lake to the northwest in Barton.

Only two areas had material acceptable for Sub-base of Gravel, Item 201; and Item 704.05, Gravel for Sub-base. Probably the order of desirability due to volume or availability would be Map Identification Numbers 6 and 12.

The gravel supply in Sutton is very limited and much sought after.

Sources of material acceptable for Sub-base of Sand, Item 202; and Item 703.03, Sand Borrow and Cushion, are located at Map Identification Numbers 1, 2, 3, and 14, all of which have pits; and 6, 8, 10, and 13, which do not have pits at present.

The following Map Identification Numbers are listed in order of volume: 10, 1, 2, 3, 13, 6, 8; Number 14 is very limited.

Sand is more plentiful than gravel in Sutton, but there are no large sources; Map Identification Number 10 is probably the greatest single source of sand in town and has about 100,000 cubic yards (estimated).

Several shallow, tiny ponds appear to have granular bottoms, but the only way to exploit this material would be by dragline or clamshell.

In the Granular Data Sheets in the column headed "Passes VHD Spec.," the writer used the old items; namely, Item 105, Granular Borrow; Item 201, Sub-base of Gravel; Item 202, Sub-base of Sand. In the "Remarks" column it is

noted where the material meets or fails to meet the requirements of the new specifications for: Item 703.05, Granular Borrow; Item 703.03, Sand Borrow and Cushion; and Item 704.05, Gravel for Sub-base. Where the 200-mesh sieve is used it is sometimes possible to determine if a material passes the old specifications (i.e. the amount passing the 270-mesh sieve) by the use of actual analysis or statistical data.

SUMMARY OF ROCK FORMATIONS IN THE TOWN OF SUTTON

Eastern Vermont Sequence

Gile Mountain Formation - Gray quartz - muscovite phyllite or schist, interbedded and intergradational with gray micaceous quartzite, calcareous mica schist, and locally quartzose and micaceous crystalline limestone like that of the Waits River Formation. The phyllite and schist commonly contains porphyroblasts of biotite, garnet, or staurolite, and locally, kyanite, andalusite, or sillimanite.

Waits River Formation - Gray quartzose and micaceous crystalline limestone weathered to distinctive brown earthy crust; interbedded and intergradational with gray quartz-muscovite phyllite or schist. Where more metamorphosed the limestones contain actinolite, hornblende, zoisite, diopside, wollastonite, and garnet; and the phyllite and schist, biotite, garnet, and locally andalusite, kyanite, or sillimanite.

New Hampshire Plutonic Series

Granitic Dikes - Gray granitic rock varying from fine- to coarse-grained. Width and extent of individual dikes not determined.

Granite - Undifferentiated granitic rock, light- to dark-gray, medium- to coarse-grained granodiorite to quartz monzonite.

GLOSSARY OF SELECTED GEOLOGIC TERMS

Alluvial - Pertaining to material carried or deposited by running water.

Breccia - A rock consisting of consolidated angular rock fragments larger than sand grains. There may be fault, talus, and volcanic breccia.

Calcareous - Pertaining to or containing calcium carbonate.

Carbonate Rocks - Rocks composed of the molecule CO_3 combined with calcium, magnesium, etc. Includes limestones and dolomites.

Delta - A predominantly alluvial deposit built by a stream entering the sea or other body of water. Usually it has the form of the Greek letter delta.

Dolomite - A rock consisting predominantly of the mineral calcium magnesium carbonate (dolomite), containing carbon dioxide 47.7%, lime 30.4%, magnesia 21.9%.

Esker - A long, narrow, winding ridge of mixed sand and gravel deposited by a stream of meltwater flowing in a tunnel or crevasse in stagnant glacial ice.

Fluvial - Of or pertaining to rivers or river action. Produced by river action.

Ice Contact - Refers to sediments which have accumulated in contact with stagnant or wasting glacial ice. They assume the varied topographic forms expressed by eskers, kames, and kame terraces.

Kame - A conical hill of generally poorly stratified drift deposited in contact with glacial ice by streams flowing in or on the ice.

Kame Terrace - Stratified sands and gravels deposited by streams between a glacier and an adjacent valley wall.

Kame Moraine - An accumulation of material deposited directly from the frontal portion of the glacial ice and partially sorted by water action. The deposits may take the form of coalescent knolls, hummocks, and ridges.

Limestone - A bedded sedimentary rock consisting chiefly of calcium carbonate. The most important and widely distributed of the carbonate rocks.

Marble - A soft, white rock being the metamorphic form of limestone in which the calcium carbonate (calcite) is recrystallized and the calcite crystals are overgrown and interlocked with additional calcite. Commercially it is a trade name applied to any carbonate rock of good color and texture and hard enough to take a polish.

Metamorphic Rocks - Rocks that owe their distinctive characteristics to the transformation of preexisting rocks through intense heat or pressure or both.

Phyllite - A fine-grained, foliated metamorphic rock intermediate between the mica schists and slates into which it may grade. The foliation is made possible by the development of a large amount of potash mica, sericite, which also gives the rock a distinctive silvery appearance.

Physiographic - Pertaining to the physical divisions of the earth.

Quartzite - A compact metamorphic rock composed of quartz grains so firmly cemented that fracture takes place across the grains and the cementing material with equal ease.

Siliceous - Containing or pertaining to silica (silicon dioxide SiO_2).

Slate - A very fine-grained homogeneous metamorphic rock which splits smoothly along parallel cleavage planes and yields roughly similar slabs.

Till - An unsorted, unstratified, and unconsolidated heterogeneous mixture of clay, silt, sand, gravel, and boulders deposited directly by glacial ice.

Appendix I

PARTIAL SPECIFICATIONS FOR HIGHWAY CONSTRUCTION MATERIALS

Listed below are partial specifications for Highway Construction Materials as they apply to this report at date of publication. For a complete list of specifications see Standard Specifications for Highway and Bridge Construction, approved and adopted by the Vermont Department of Highways in April, 1964.

Item 105, Granular Borrow

"Article 105.02 - Materials. The granular borrow shall be obtained from approved sources and shall consist of satisfactorily graded, free-draining, hard durable stone and coarse sand practically free from loam, silt, clay, and organic matter.

"The sand portion (material passing the No. 4 screen) shall have not more than ten percent (10%) passing the No. 270 mesh sieve and shall show a color of not more than three and one-half ($3\frac{1}{2}$) as determined by the colorimetric test described in AASHO Method of Test, Designation T-21.

"When used in connection with fine grading or in fills where piling is to be driven, the granular material shall all pass the nine-inch (9") square-opening screen."

Item 201, Sub-base of Gravel

"Article 201.02 - Materials. The gravel shall consist of material reasonably free from silt, loam, clay or organic matter. It shall be obtained from approved sources and meet the following requirements.

"Not less than forty percent (40%) stone shall be retained on No. 4 sieve.

"The percent of wear shall be not more than twenty-five (25) when tested by laboratory methods using Method T-4 or more than forty (40) when tested by AASHO Method T-96.

Appendix I
page I

"The stone portion of the gravel shall be uniformly graded from coarse to fine, and the maximum-size particles shall not exceed two-thirds (2/3) of the layer being spread.

"The sand portion, when tested by laboratory methods using Method AASHO T-27, shall meet the grading requirements set up in the following table:

Minimum Percent of Stone	Percent Passing Square Openings No. 100	Percent Passing Square Openings No. 270
40	0-15	0-3
50	0-15	0-4
60	0-15	0-5
70	0-15	0-6

"The sand shall show a color of not more than three and one-half (3½) as determined by the colorimetric test described in the AASHO Method of Test, Designation T-21."

Item 202, Sub-base of Sand

"Article 202.02 - Materials. The sand shall consist of material reasonably free from silt, loam, clay, or organic matter. It shall be obtained from approved sources and meet the following requirements:

"The sand, when tested by laboratory methods using Method AASHO T-27, shall meet the grading requirements set up in the following table:

Square Openings	Percent Passing
1½"	95-100
5/8"	80-100
No. 4	70-100
No. 100	0-18
No. 270	0-5

"The sand shall show a color of not more than three and one-half (3½) as determined by the colorimetric test described in the AASHO Method of Test, Designation T-21."

Item 204, Sub-base of Crushed Rock

"Article 204.02 - Materials. The materials for sub-base, filler, and sand cushion shall be obtained from approved sources and meet the following requirements:

A - Crushed Rock. "The crushed rock shall be uniformly graded, crusher-run material and shall be free from dirt. The ledge from which this material is obtained shall be stripped and cleaned before blasting. Conical stockpiling, or any other method of stockpiling which causes segregation of aggregates, will not be permitted.

"The crushed rock, when tested by laboratory methods using Method AASHO T-27, shall meet the grading requirements set up in the following table:

Square Openings	Percent Passing
4"	95-100
1½"	25-50
No. 4	0-15

"The percent of wear shall not be more than eight (8) when tested by laboratory methods using Method AASHO T-3 or more than forty (40) when tested by AASHO Method T-96."

Item 205, Sub-base of Crushed Gravel

"Article 205.02 - Materials.

A - Crushed Gravel. "The crushed gravel shall consist of material reasonably free from silt, loam, clay, or organic matter. It shall be obtained from approved sources and produced by a crusher adjusted to deliver a product uniformly graded from coarse to fine.

"When tested by laboratory methods using Method AASHO T-27, it shall meet the grading requirements as set forth below:

Sub-base of Crushed Gravel	Coarse-Graded Item 205-A	Square Openings	Percent Passing
	Finé-Graded Item 205-B	4" No. 4 1½" No. 4	100 25-50 95-100 30-60

"At least thirty percent (30%) by weight of the stone content of the crushed gravel, that is, the material retained on the No. 4 screen, shall have a minimum of one (1) fractured face as determined by actual count from the sample submitted to the laboratory.

"The percent of wear shall not be more than twenty (20) when tested by laboratory methods using Method AASHO T-4 or more than thirty-five when tested by AASHO Method T-96.

B - Sand. "The sand content of the crushed gravel, that is the material passing the No. 4 screen, when tested by laboratory methods using Method AASHO T-27, shall meet the grading requirements set up in the following table:

Square Openings	Percent Passing
No. 100	0-18
No. 270	0-8

"The sand shall show a color of not more than three and one-half (3½) as determined by the colorimetric test described in the AASHO Method of Test, Designation T-21."

Item 207, Sub-base of Dense Graded Crushed Rock

"Article 207.02 - materials. The crushed rock shall consist of granular fragments of hard, durable rock, of uniform quality throughout, reasonably free from thin or elongated pieces, soft or disintegrated rock, dirt or other objectionable matter."

"The rock shall meet the following requirements:

"The percent of wear shall be not more than eight (8) when tested by laboratory methods, using Method AASHO T-3, or more than forty (40), when tested by AASHO Method T-96."

"When tested by laboratory methods, using Method AASHO T-27, the material shall meet the requirements set up in the following table:

Grading	Square Openings	Percent Passing
	3"	100
	2"	80-100
	1½"	50-75
	No. 4	30-55
	No. 100	3-10
	No. 270	0-6

Appendix I
Page E

"The dense graded rock shall be homogeneous and shall be produced and manipulated in such a manner as to prevent segregation before material is spread on the prepared subgrade, or at other locations."

PARTIAL SPECIFICATIONS FOR HIGHWAY CONSTRUCTION MATERIALS

Listed below are partial specifications for Highway Construction Materials items that will supercede the items currently in effect on July 1, 1971. The new items are included as an appendix to this report since the suitability of materials for construction is referred to the new items in many instances.

DIVISION 700 - MATERIALS

Section 703, Soils and Borrow Materials

703.03 Sand Borrow and Cushion

Sand Borrow shall consist of material reasonably free from silt, loam, clay, or organic matter. It shall be obtained from approved sources and shall meet the requirements of the following table:

Table 703.03A - Gradation Requirements

Sieve Designation	Percentage by Weight Passing Square Mesh Sieves Total Sample	Sand Portion
2"	100	
1½"	90-100	
½"	70-100	
No. 4	60-100	100
No. 100		0-30
No. 200		0-12

703.05 Granular Borrow

Granular Borrow shall be obtained from approved sources, consisting of satisfactorily graded, free draining, hard, durable stone and coarse sand reasonably free from loam, silt, clay, and organic material.

The Granular Borrow shall meet the requirements of the following table:

Table 703.05A - Gradation Requirements

Sieve Designation	Percentage by Weight Passing Square Mesh Sieves Total Sample	Sand Portion
No. 4	20-100	100
No. 200		0-15

The maximum size stone particles of the Granular Borrow shall not exceed 2/3 of the thickness of the layer being spread.

Section 704, Aggregate

704.05 Gravel for Sub-base

Gravel for Sub-base shall consist of material reasonably free from silt, loam, clay, or organic matter. It shall be obtained from approved sources and shall meet the following requirements:

(a) Grading

The gravel shall meet the requirements of the following table:

Table 704.05A - Gradation Requirements

Sieve Designation	Percentage by Weight Passing Square Mesh Sieves
	Total Sample
No. 4	(20-60)
No. 100	100
No. 200	0-18
	0-8

The stone portion of the gravel shall be uniformly graded from coarse to fine, and the maximum size stone particles shall not exceed 2/3 the thickness of the layer being placed.

(b) Percent of Wear

The percent of wear of the gravel shall be not more than 25 when tested in accordance with AASHO T 4, or more than 40 when tested in accordance with AASHO T 96.

704.06 Crushed Stone for Sub-base

Crushed Stone for Sub-base shall consist of clean, hard, crushed stone, uniformly graded, reasonably free from dirt, deleterious material, pieces which are structurally weak and shall meet the following requirements:

(a) Source

This material shall be obtained from approved sources and the area from which this material is obtained shall be stripped and cleaned before blasting.

(b) Grading

This material shall meet the requirements of the following table:

Table 704.06A - Gradation Requirements

Sieve Designation	Percentage by Weight Passing Square Mesh Sieves
	Total Sample
4½"	100
4"	90-100
1½"	25- 50
No. 4	0- 15

(c) Percent of Wear

The percent of wear of the parent rock shall be not more than 8 when tested in accordance with AASHO T 3, or the crushed stone a percent of wear of not more than 40 when tested in accordance with AASHO T 96.

(d) Thin and Elongated Pieces

Not more than 30 percent, by weight, of thin and elongated pieces will be permitted.

Thin and elongated pieces will be determined on the material coarser than the No. 4 sieve.

(e) Filler

The filler shall be obtained from approved sources and shall meet the requirements as set up for Sand Cushion, Subsection 703.03.

(f) Leveling Material

The leveling material shall be obtained from approved sources and may be either crushed gravel or stone screening produced by the crushing process. The material shall consist of hard durable particles, reasonably free from silt, loam, clay or organic matter.

This material shall meet the requirements of the following table:

Table 704.06B - Gradation Requirements

Sieve Designation	Percentage by Weight Passing Square Mesh Sieves	Total Sample
1"		100
3/4"		90-100
1/2"		50- 90
No. 4		30- 70
No. 100		0- 20
No. 200		0- 10

704.07 Crushed Gravel for Sub-base

Crushed Gravel for Sub-base shall consist of material reasonably free from silt, loam, clay or organic matter. It shall be obtained from approved sources and shall meet the following requirements:

(a) Grading

The crushed gravel shall be uniformly graded from coarse to fine and shall meet the requirements of the following table:

Table 704.07A - Gradation Requirements

Grading	Sieve Designation	Percentage by Weight Passing Square Mesh Sieves	Sand Portion
Coarse	4"	100	
	No. 4	25- 50	100
	No. 100		0- 20
	No. 200		0- 12
Fine	2"	100	
	1½"	90-100	100
	No. 4	30- 60	0- 20
	No. 100		0- 12

(b) Percent of Wear

The percent of wear of the parent gravel shall be not more than 20 when tested in accordance with AASHO T 4, or the crushed gravel a percent of wear of not more than 35 when tested in accordance with AASHO T 96.

(e) Fractured Faces

at least 30 percent, by weight, of the stone content shall have at least one fractured face.

Fractured faces will be determined on the material coarser than the No. 4 sieve.

704.09 Dense Graded Crushed Stone for Sub-base

Dense Graded Crushed Stone for Sub-base shall consist of clean, hard, crushed stone, uniformly graded, reasonably free from dirt, deleterious material and pieces which are structurally weak, and shall meet the following requirements:

(a) Source

This material shall be obtained from approved sources and the area from which this material is obtained shall be stripped and cleaned before blasting.

(b) Grading

This material shall meet the requirements of the following table:

Table 704.09A - Gradation Requirements

Sieve Designation	Percentage by Weight Passing Square Mesh Sieves	Total Sample
3½"	100	
3"	90-100	
2"	75-100	
1"	50- 80	
½"	30- 60	
No. 4	15- 40	
No. 200	0- 10	

(c) Percent of Wear

The percent of wear of the parent rock shall be not more than 8 when tested in accordance with AASHTO T 3, or the crushed stone a percent of wear of not more than 40 when tested in accordance with AASHTO T 96.

(d) Thin and Elongated Pieces

Not more than 30 percent, by weight, of thin or elongated pieces will be permitted.

Thin and elongated pieces will be determined on the material coarser than the No. 4 sieve.

704.10 Gravel Backfill for Slope Stabilization

Gravel Backfill for Slope Stabilization shall be obtained from approved sources, consisting of satisfactorily graded, free draining, hard, durable stone and coarse sand reasonably free from loam, silt, clay, and organic material.

The gravel backfill shall meet the requirements of the following table:

Table 704.10A - Gradation Requirements

<u>Sieve Designation</u>	<u>Percentage by Weight Passing Square Mesh Sieves</u>	
	<u>Total Sample</u>	<u>Sand Portion</u>
No. 4	20-50	100
No. 100		0- 20
No. 200		0- 10

The stone portion of the gravel backfill shall be uniformly graded from coarse to fine, and the maximum size stone particles shall not exceed 2/3 the thickness of the layer being placed.

704.11 Granular Backfill for Structures

Granular Backfill for Structures shall be obtained from approved sources, consisting of satisfactorily graded, free draining granular material reasonably free from loam, silt, clay, and organic material.

The granular backfill shall meet the requirements of the following table:

Table 704.11A - Gradation Requirements

<u>Sieve Designation</u>	<u>Percentage by Weight Passing Square Mesh Sieves</u>	
	<u>Total Sample</u>	<u>Sand Portion</u>

6	1970	1.5-2	0-1.5	No	63.4	53.3	43.8	18.0	6.7	2	28.7%	Test #6 was dug on top of small rise in south end of field, 435' S. 4C° W. of Test #5. Bedrock at 21'. Not sampled.
7	1970	1-9	0-1	No	4C.2	42.4	36.0	26.0	0.7	5	---	Test #7 was dug at east base of small rise, 210' N. 68° E. of (Grav.) Test #6. Loc. of Test #7: C'-2', overburden; 2'-7', sandy gravel; 7'-9', cobbley Gravel with several +24-inch boulders; 9', water.
8	1970	1-10	0-1	No	100	100	100	94.1	29.0	1	---	Test #8 was dug in southwest corner of field, 150' N. 75° E. of (Grav.) Test #7. Loc. of Test #8: C'-1', overburden; 1'-2', gravel; 2'-3', sand; there is a 2" seam of clay; 3'-4', sand; 4', gravel and water; 4'-5', water, sand, gravel, and silt. Insufficient proper size stones were included for the wear test.
9	1970	1-10	0-1	No	100	100	100	94.1	29.0	1	---	Test #9 was dug in middle of field, 120' south of tree line, end 100' west of Vt. Route No. 5A. Access is just south of the junction of Town Highway No. 12 with Vt. Route No. 5A. Test #9 was dug in an area that was mapped as kame terrace. However, sample is mostly a rotted rock material with a sugary texture,

5	1970	3-4.5	0-3	No	100	94.2	85.6	66.0	22.7	1	---

Test #2 was dug atop knoll 210' S. 5°W. of Test #1. Log of Borrow (Grav.) Test #2: 0'-1.5', overburden; 1.5'-4', large boulders; 4'-10', bouldery coarse gravel; bottoms on bedrock or boulder. Passing #100 sieve, 16.0%; passing #200 sieve, 8.1%. This sample barely fails for Item 201 and Item 704.05, gravel items.

Test #3 was dug on the flats, 100' S. 5°E. of, and 13' below Test #2. Log of Test #3: 0'-1', overburden; 1'-8', tan sand with some pebble lenses and silt; water at 8'; 8'-10', fine sand and silt; 10', very large boulders; ledge or large boulder at 11'.

Test #4 was dug in uncut low Test #1. Log of Test #4: 0'-1', overburden; 1'-6', dirty, rather fine gravel; much water flows in from north end of hole at 6'; 6'-7', fine pebbly gravel; 7'-8', coarse bouldery gravel; 8'-10', gravel.

Test #5 was dug in northeast section of field. Hole is below Tests #1-4, and material is finer which suggests that this test was further downstream from Tests #1-4. Test #5 was dug 240' S. 50°W. of large elm in low stone wall.

6	1970	1-9	0-1	Yes	100	49.8 9.0	4.4	2	---	Log of Test #5: 0'-3', overburden; 3'-4.5', layer of pebbles and silt; 4.5'-6', silt and water. Test #6 was dug on face of tiny pit. Pit is at southwest end of a low wooded ridge which may be a small esker. The top of the feature is about 25' above a marshy area to the west, and about 10'-15' above pit floor. The feature extends 250'-300' N. 35°E., and is about 50'-75' wide.
9	1	1970	0.5-5	0-0.5	No	93.9 91.7	86.2 23.0	8.9	1½	Log of Test #6: 0'-1', overburden; 1'-3', brown sand; 3'-5', sand; 5'-6', boulders; 6'-7', fine gravel; 7'-9', sand and boulders. Boulders were large and not well-rounded. Some fine gravel noted, but overall, the material is a sand with a fairly high stone content which is not uniformly graded enough to pass for gravel.

The bottom of the test was 3' above the level of the brook. Sample has just a few too many stones to meet new gravel specifications, Item 704.05, but meets requirements for Item 201.
13	1A	1970	2-6	0-2	No	58.3	48.8	39.0	16.0	5.0	1½	29.1%	Gran. Borrow (Grav.)	Test #2 was dug near the narrow, south end of field, 275' S. 35°E. of Test #1. Log of Test 2: 0'-1', overburden; 1'-4.5', coarse gravel; test bottoms at 4.5' in blue clay.
13													This feature does not have much material in it, but could be a source for local use.	Owner: Mrs. Frances LaBrozzi. Area is a field with small, shallow diggings, southwest of, and above Calendar Brook, 0.1 mile northwest of the southwest end of Town Highway No. 29. D. P. Stewart has mapped the area as pebbly sand, but its position suggests it is more likely a kame terrace. Test #1A was dug in the field 170' S. 70°E. of fence opening in northwest end of field. Log of Test #1A: 0'-2', overburden; 2'-6', very fine gravel. Passing #200 sieve, 10.5%.

6	1970	1-10	0-1	Yes	100	64.0 30.0 100 13.8 1	---	---	Included for wear test. Test #6 was dug on southwest face of pit, 50' southwest of Test #5. Log of Test #6: 0'-1', overburden; 1'-2', pebbly sand; 2'-10', rotted rock fragments; test bottoms in same. This is the reason for pit ending where it does.
14	1	1970	1.5-12	0-1.5	No	100 95.0 87.7 13.2 2.3 1½ ---	Sand	Owner: Robert G. Simpson. Area is tiny bank or pit, north of State Aid Highway No. 1, 0.05 mile west of the Burke Town Line. There may be an extension up a wooded slope which trends N.25°W., but heavy underbrush covered signs of material. A large, weathered boulder is in the north face of pit, and lies over sand and under a thin cap of gravel. This may have been due to ice-rafting. The area is small and very localized. Owner did not want sampling with backhoe. Test #1 was a hand-shovel sample of northwest face. Log of Test #1: 0'-1.5', overburden; 1.5'-3', fine sand; 3'-6', pebbly sand; 6'-12', medium sand; test bottoms in same. There is a drain trench just south of the face which indicates a downward limit of the material.
